That sounds like a very interesting project, but I must say no. I just
dont have time at this point. All my focus is going into oVDI atm. I just
thought that if the sources where actually available, I'd make sure I got
my hands on them and do something with it later, if noone else did. We
need a new harddisk driver implementation for MiNT :-)

Message-ID: <20040101020734.a19411@du3.maus.de>
Source record: 21993

>Do you speak about a new modified 060 nova driver or the orginal one ???

Both. :-)

>If nobody patched the driver, it may not work !
>If there is no board, the driver sees that and some accesses to the board
>are not done !

Someone wrote a new emulator.prg and this one worked (without NOVA). Then I received a new STA_VDI.PRG and therefore I tried to reinstall the NOVA. But when I did my first tests with my NOVA the falcon booted (although when running emulator.prg it crashed with a debug output). This time it even didn't had a chance to crash (distorted ATARI logo).

>So, the fact that the driver runs alone doesn't mean that the driver is
>good with 060 !

:-(

I hoped not to hear that.

Regards,

Frank

If you have it booted by floppy, open the Control Panel: General
CPX/Status shows TOS version. If you need a control panel, E-mail me
(remove -NOT- from my address) and I'll send you XCONTROL.ACC and some
CPXs.

>

Again, if you have it booted by floppy, open the Control Panel: General
CPX/Status shows available RAM. If you see available RAM over 4 meg (most
likely over 12 meg with little in the Auto folder) then you're fitted with
a 16 meg board (14 meg recogniized). If you see over 1 meg you have a 4 meg
board. Under a meg you have only a 1 meg board! The bigger the better!

Thanks for that. You learn something new every day. The Xserver seems
to work ok but it is a bit sluggish even on this Milan060. I had just
assumed this was because it was a Unix port and not as efficient as
aes/vdi.

Don't worry too much about back-porting stuff. The Yahoo Messenger
is just a "nice to have".

Have a Good New Year,

Peter

If you can get Emulator.prg to run, and the XCB API is the same across
all cards Nova drives, perhaps you'd be interested in testing this with
oVDI instead of STA_VDI? If you are on the MiNT-list you know how to get
to the source and compile yourself a binary. If not, let me know.

Nice clichï¿½, but that is not really the point now, is it?
I question how this forum benefits from personal insults and foul language.
If it doesn't, I sure would say it is unfortunate.

Happy New year to you too. GIM text draw routines are nearly completed.
The up and coming weeks should prove interesting. I hope to get a basic
buddy list/im window structure completed. I'm using a plugin design
architecture, once I get one protocol I should be able to have any one of
them :) To save space though I will probably distribute a BUNCH of
binaries, gimoscar030.prg, gimoscar.prg, gimyahoo030.prg, so forth so that
everyone out there is happy. And of course once I make a binary release I
will honor the GPL and distribute my source so that the public may
ridicule it (or fix it! :))

Thanks,
Mark

>
> I guess the Atari ST is just another bloatware machine just like the
> pee see, mac, and amiga.

Actually, an ST with 4meg will indeed multitask slews of programs and the programs are usually well under 10k in size. Where the bloat comes into play is when people decide they want a modern looking desk top with colorful icons, a screen saver lurking in memory, several desktop accessaries loaded at once, an array of disk caches, and to use scaleable vector fonts both onscreen and printing. To use a TT font via GDOS etc etc etc...for any decent speed requires caches for rasterized versions of the fonts, blah blah.

This is why people recommend 4 meg or more for the best ST multitasking experience. These tend to be folks who are used to running NVDI with an array of vector fonts at their disposal, quite a few hard disk partitions...maybe some CDROM drivers, a fancy desk top that supports long file names and has stunning graphics, etc.......

.The fact is however, that the LARGEST TOS/GEM applications I've ever seen top out at 400kb, rescources and all...and easily fit on a single 1.44 floppy. The other disks might be full of fonts and stuff that you don't always need at once...if at all. Such 'large' applications tend to be massive suite like packages...such as CuBase Audio that is really several dozen apps all rolled into one. It's really a multi tasking experience in itself when you launch a 'beast' like this. Launch CAF, and there is a note pad in there, there are sample editors akin to SOX in there, there is a full MIDI engine in there...with a dozen editor modules that are often loaded into memeory *but can be disabled for space if ya want*, maps, effects, and so much more. Sure, maybe by today's standards it is bloat to put all these things into one application...but to be fair, back when these packages were written, there was no 'standard' to load 50 pieces of code all written by different folks and sold by different publishers....so...when they did a package, they packed all the 'bloat' under one hood....so hopefully you wouldn't need to run something else in the first place! Load CuBase, and do pretty much everything you need right there in that environment.

So...if we take a package like that apart...
Text Editor...2k
MIDI engine...20k or smaller
Audio engine...20k or smaller
Editors/maps/modules...20k or smaller

Printer routines....20k or smaller
User Interface...20k or smaller...

Well...the point I'm trying to make is that when you consider what all this kind of software does...it's still very small!

I suppose it can be bloat if there's alot of stuff in a suite you never use... But again, lets be fair....
Alot of the 'monster' applications that recommended 'at least' a 1 meg ST were actually done in a modular fashion where you could 'choose' not to enable every single module or feature at the same time. Hence, if it was 'bloat'....it was because the USER chose to load the module...not because the computer or the software sucked. Alot of them would work fine inside 1meg....you just couldn't enable all the 'bloat' at once and have room left over for data and its manipulation.

The major problem with the ST was that there wasn't any standard for multitasking....
So....for various publishers to provide a multitasking-like suite of tools...they did often reinvent the wheel and bloat up programs larger than they'd need to be had there been a 'standard'. I.E. If you could use any text editor you wanted side by side with CuBase...they would not have bothered to include a 'note pad' in the CuBase code, and boom...2k or more would be shaved off the thing just like that. Had their been a reliable way to run SOX alongside CAF without ever having to exit...they wouldn't have bothered to put sample conversion routines right there in the program....and so on.

All considered...I think it's amazing how well done and lean the top commercial apps for the ST were/are!

In Closing...
If you're sticking with the built in system fonts (no font caches).....and don't fill your memory up with desk top pictures and 16-256 color icons....you CAN indeed multask a hell of alot of apps in a 1meg ST.

When it comes to peeks and pokes, working with simple screens...code is small on all the platforms. It's pretty elementary to me.

Brian

17. F/X BlowUp accelerator card

Newsgroup: comp.sys.atari.st
Date: 2004-01-02 17:38:44 UTC
From: Carey Christenson <falcon060@adelphia.net>
Message-ID: <1073043576-079072AEicMi@adelphia.net>
Source record: 21906

Anyone,
I posted this 4 or 5 days ago and some google
searching has turned up hardly any information. If
you know anything about these 2 upgrades below please
contact me via e-mail or post here in CSAST.

Thanks,
Carey

Does anyone have any information on the F/X BlowUp
card for the Falcon 030?? I just acquired a Falcon
030 with this card in it and wish to see technical
specs on this card. Any web-sites or information on
this card would be greatly appreciated. I also
acquired a 1040 STf with 4 megs of STram soldered in
place and this 1040 STf has a PC Ditto II card
soldered on to a LONG chip in front of the DISK DRIVE.

Any information that someone can provide for this
adapter would be greatly appreciated also. The board
is about 1 inch by 3 inches and has 2 rows of pins the

whole width (3 inch direction) of the board. If
anyone knows what this board is and how I can utilize
its capabilities I would greatly appreciate the
information.

Thanks,
Carey Christenson

Back in 1990 or so I had a pc-ditto II card installed in my 1040STfm. It was a good hardware PC emulator that used the NEC V30 chip. From what I recall, it connected directly on top of the 68000 chip. It does require special software to activate, which I no longer have. There was a lot of controversy when pc-ditto II was first released as it was too large to fit in a lot of people's STs. It also was not supposed to require soldering, but those who were able to get it working almost always had to solder it.

19. Falcon030 Hard Drive upgrade

Newsgroup: comp.sys.atari.st
Date: 2004-01-02 19:23:25 UTC
From: Paul Lefebvre <atari@logicalvue.com>
Message-ID: <BC1B2F5B.43B4%atari@logicalvue.com>
Source record: 21908

Hello all,

I want to thank everyone with their help over the last couple months with my CD-ROM problems. I could never get my AppleCD 300e to work with my Falcon, but I picked up a Plextor 4Plex Plus on eBay and that worked right away without any troubles.

My next project is to replace the hard drive in the Falcon with a bigger model. My Falcon has a lowly 65MB Seagate drive. It works fine, but I figure it can't hurt to have more.

I picked up an 810MB drive off eBay for $10 but have not had any luck getting it to work with. It hooks up fine and I can hear it spin up, but for some reason it renders the floppy drive inoperable so I can't run any of my hard driver software to see if is recognized. I don't know the make of the drive as its labels were removed.

Since I'm about to give up on that drive I'm wondering if people could recommend some drive models that they know work in a Falcon and also perhaps some places to purchase them. I'm thinking 1 to 2GB ought to be enough.

Thanks,

-- Paul

Hmmm... I read that in the english docs too... Anyone got that disk??? You
can freely mail it to me :)

Ok, it was just a silly proposition (what with me not having an hdd and
all :)

When I get an hdd actually running on my STE (no other Atari computers
here!) my interest might fire up again on that project. I hope MiNT will
run ok on my machine :))) But remember me if you will actually need at
some point the source.

I've been playing with the drive a little bit more and finally got the
Falcon to recognize it. According to HDX 6 and CBHD, the drive is an
Hitachi DK212A-81.

Of course I am unable to format it or partition it. I get an error that
says "unable to read root sector".

Freedom of speech is a nice idea, and it may give you the right to say anything you want, offensive or not, but it doesn't mean you can be callous and offensive and somehow magically not be an arsehole for having done so.

As for that "free not to read it" business, in order to figure out if a post is offensive, you have to have already read it. Slight flaw in the plan, wouldn't you say?

Now, in a feeble and probably doomed attempt to steer this thread away from bickering and onto something productive: Assuming it isn't just an automated posting program (perhaps somebody could make a list of all the Bravo Sierra posts and check to see if it's just generated from a list or something), can anyone think of any, preferably legal, morally justifiable and reasonably likely-to-succeed way of shutting Bravo Sierra the hell up? Or at least reducing the flow a bit? I heard the argument a while back that continued advertising is necessary to keep people aware, but we're getting simultaneous posts now, often before the last batch has even timed out and disappeared. If nothing else, can we PLEASE have just one at a time, rather than getting swamped??

Tom

I just purchased a TOS Extension Card from Germany so the manual is in German (of course). Ive looked on google for some help but nothing has ever been posted about the single wire that comes the chip on the card. Can some one please tell me where this wire goes? It has a gold pin on the end. Also is there anything else that needs to be done to the mega motherboard for the installation of this unit?

Don

This has been discussed a trillion times on this group. You need an updated
Hard Drive Driver to make it work with larger drives. HDDriver, SCSI-Tools
are two that work with larger drives. I have used 2GB, 4GB and 8GB laptop
drives in mine.

I am using CBHD as my hard disk driver, but as I mentioned I cannot even run it since the floppy drive stops reading disks when the hard drive is plugged in.

Although I had seen the hard disk driver topic discussed much in the archives, I have found no reference to the associated floppy drive problem.

I did get the hard drive to be briefly recognized by mucking around with the jumper switches until the floppy worked but I was unable to partition it using CBHD or AHDI 6. Now it doesn't even want to spin up, so I'm just writing it off as a bad drive.

Hi Paul,
I'm not the resident expert nor do I know if it effects floppy
recognition but I do know that improper termination would effect the system
The last physical drive in the chain must be terminated by a jumper on
the hard drive, passive terminator on the last connector and I've heard
of resistors on the drive.

John

Where the card is from? Hard&Soft ?
But "TEC" sounds like more it is from ddd.

I think it is the chip select wire.

Paul doesn't say whether this is an IDE or SCSI drive! I guess that this is an IDE drive and that it's actually faulty. No termination issues with these, only jumper positions Master, Slave, Cable select that I know of.

> The last physical drive in the chain must be terminated by a jumper on
> the hard drive, passive terminator on the last connector and I've heard

For SCSI drives I recommend setting TERMPWR to ON (with a jumper), and then either using the drive's own termination resistors if it's the only SCSI device, or removing them and rely on an external terminator on the second SCSI port on the case (better, as this allows extending the system at a later date).

I was, in vain, trying to be fascicious (spelling?) as in: free to commit crimes if you don't mind doing the jail time! I would also consider (as someone else mentioned in this thread) that the original remark has a different connotation today then years ago and it reduces the meaning to just plain sarcastic. Ex: a phone company rep told me that I was being vulgar and hung up on me because I said I was getting "screwed" by the company! Guess I should have said I was getting the same service as a bull services a cow!
But then, if I had a "challanged" person in my home or I if were challanged then it would be more offensive hearing the word "retard"!
Another thing to consider is that the person that the remark was directed to has been asked politely to stop or at least reduce the number of ad posts but the requests go unheeded! If the few remaining Atari dealers did the same then the newsgroup would be swamped with ads!
So, the word "retard" as seen here is out of context without knowing the history of frequent threads on the matter. Remarks like that are frequently said out of frustration. Personally though, I would have (and have) put it differently!

Yes, I think many of us reading this forum aren't too fond of this way
of marketing, to put it mildly.

> history of frequent threads on the matter. Remarks like that are
> frequently said out of frustration. Personally though, I would have

Source record: 21931

Hi all.
I am trying to get XP and TT030 to talk to each other. I follow
all the instructions. My card NE2000 show mac as ff.ff.ff.ff.ff on the
control panel via sting setup. I noticed that on the two light only the
green flashes and orange stays off when I connect Ethernet cable this my
setup.
TT030=EtherNet=Cable=Hub=Cable=Ethernet=XP
TT030 192.168.255.1
XP 192.168.255.2
Any clues would help.

regards sore spot on my head john

What kind of NE2000 card do you have.. Are you using EtherNEC? Did the
card come from Lyndon as well as the EtherNEC?

Thanks,
Mark

Hi George,

GN>Anyone got that disk??? You can freely mail it to me :)
as I'm unable to find the sources of CBHD neither on my 2.33 original
nor on a 5.67 version, I doubt if the sources of the driver itself
have ever been published.

You might imagine what harm some unexperienced user could do to
himself (to his hard drive, of course) by using a modified disk driver
that came via the net from unknown origins...

There are sources of programs that came with CBHD, most of them in GFA
or Assembler, but there is no file like CBHD.C or CBHD.S or ...

Sorry, Peter

>card come from Lyndon as well as the EtherNEC?

Add to that these important quetions:

Which IP stack?
Which operating system?

I know what I would like to see!!! First off, we all know that the completion of the CT60 Graphics Card may well be the first thing done in 2004. But what will R. Czuba do??? We all know that he may be working on the PCI/USB adapter. But remember what he said about Vernanelm!!! This may have hurt our platform for further hardware upgrades. I would personally like to THANK Vernanelm for that (sarcacism of course!!!). By the way has anyone setup a FUND for Mr. Czuba to contribute whatever they can to this fund and hand the monetary donations over Rodolphe??? If this PCI adapter comes into play we would need developers to write drivers for PCI cards. Some of the first PCI cards I would like to see drivers written for are 10/100 mbit ethernet cards and 2 channel IDE cards to allow 4 IDE devices hooked into the PCI slot. With support from major software we could see some very FAST CD-Burning and VERY FAST access from modern hard drives. Also let us not forget SoundBlaster cards which would give us 5.1 surround sound capabilities!!! Just my 2 cents worth. Of course this may not all be possible in one year but we can sit back and see.

Thanks,

Carey Christenson

I had a discussion with my friend Jose Cuervo and we think Rudolphe
should acquire the rights to TOS and set up a full blown hardware plant in
the Bahamas to build a "real" Atari and call it the Czubetchya! Free
vacation accomidations and air fare included with each system :))
After a few hours nap and without Jose's influence I'd be happy if
Okami had an installation program!

A really good development environment for gcc or PureC, with , with a good object oriented GEM-library. Something as simple and straight-forward as e.g. Visual Basic. This will really help the software situation on this platform, atleast I would write several applications I need/want if I had a powerfull tool like this...

There is a new and better VDI (oVDI) on the way, for which drivers should
be easy to write. So perhaps we see support for more graphics cards
(SuperVidel will need this to take advantage of its capabilities .. if it
appears), pointing devices, etc., etc. (oVDI will, I hope, make it very
much easier to implement USB-based drivers. That is, easier to do a USB
stack when there is a system under which USB drivers is easy to write,
like mouse/printer/kbd drivers)

Apart from that, perhaps some new network-card drivers?

I dont know if anything will happen on the Hardware front, but I think
things will happen on the software front ;-)

Thanks! In answer to these questions:

I think (and hope) we'll see continued Highwire development. I'm very impressed with what has been accomplished, and I'd love to see forms (to enter search text) and downloads supported soon. I've also been impressed with development on "MyMail", and hope to see further optimization and newsgroup support added.

I would also love to see further development related to the CT60, PCI card, graphics card, etc. I'm willing, as I'm sure others are to pay to see development continued.

This would be a good start.

Hi John, the ff.ff.ff.ff.ff, if that IS your mac and not an error, is a broadcast address. This will cause copius problems. I have heard of some cheap cards that had this address because the manufacturer stuffed up the firmware. Or, as Kenneth points out the TT may not be able to read the Data from the card correctly. The green leds are generally Link, and the orange transmit. What response to you get from a simple ICMP (Ping) test? I don't suppose you have another ISA Ne2000 to try?

Mark

Unfortunately I do not have a spare to try as for pinging the green
light flashes no orange lignt though on dialer.prg it shows route but
ping nothing happens it okay pinging myself which i suspect tells me the
ethernec is working. but no responce from xp ethernet. As for xp
ethernet pinging like works to itself but =request time out= hope this
helps. The only other thing to check is software for TT030.

REGARDS

Hi Mark

You are not running Norton Internet Security on your XP?

Are you getting any reaction using PING 192.168.255.1 from the XP
machine and PING 192.168.255.2 from the TT?

Anders

This means that the driver can't see the Ethernet card.

1) Make sure the connector card is seated properly in the cartridge socket,
and is the correct way up.

2) Run the test programs that are included with the software. What results
do they give.

3) Make sure you have the latest versions as there were some changes made
for TT030. The drivers use instruction loops to set delays and so work
differently between ST, TT and Falcon. They work on my TT but others have
had problems. See

Well... as far as I know, 255 at any place in the adress means it's a
broadcast one, so that could be one possible cause of your problems.
Just change to, for instance, 100, and it should be better.
Then, which driver did you activate in your STinG folder ? If it is the 030
one, it won't work at all : I had the same problem, and thanks to Kenneth I
could fix it by activating the Enec.stx (and not the Enec30.stx).
So, first change this 255 in your adresses (on both PC an TT side) with
something else, then use the enec.stx, and if it still doesn't work, just
drop me a mail : I'll send you the config I use on my TT.

J.-Luc

A happy new year to all people here and their families.

To this might be added that in "192.168.255.1" and "192.168.255.2" the
"255" is not exactly politically correct, though probably is passable
for most software. Probably would have been a better idea to use "0"
or any other number instead.

>> control panel via sting setup. I noticed that on the two light only the

John, are you sure that the cables are OK? I have seen these symptoms
(flashing "link" light) with faulty cables. Did you connect the RJ-45
connectors yourself? Do all the leads in the cable work? Also, I have seen
too many times UTP cables, even made by paid "professionals", which were not
laid out correctly. It is important to know: wires in an UTP cable are NOT
identical (orange, green, blue and brown pairs being twisted with different
pitches, etc.). It is not sufficient just to make a "correct" pin-to-pin
connection using whichever lead from the cable comes conveniently over a pin
on the connector being connected first. Correct wire colours must be put to
appropriate pins- otherwise you will get a cable which will appear OK when
tested with an ohm-meter but may, or may NOT work on lengths of 2-3 metres
and at 10Mbit/s, and most certainly will not work at longer lengths or
100Mbit/s. Also note that a cable for computer-hub connection is not
the same as a cable for direct computer-computer connection
(the latter having orange and green pairs exchanged on one end).

Huh?

Assuming a /24 netmask (ie. 255.255.255.0), these are perfectly valid
addresses. What makes you think otherwise?

Um - no. A network-directed broadcast address has all host bits set to one,
not just 8 bits in one byte of the host part of the address.

Hi all,

While PopGEM still lacks a maintainer, it has depite of this had another update. Except from regular cleanups and fixes, some new functionality has been added as well. In case you are new to PopGEM, it is a small tool for maintaining the inbox of your popserver. It is however a simple program, and if you are looking for something that is eg. capable of filtering out spam you should give Meg a closer look.

On a different note, we have also added aFTP to the project wishlist on TOPP. Do get in touch if you have information on the status of this program or its authors.

http://topp.atari-users.net

As always, any feedback, information and help is most appreciated!

Regards,

Joakim

>MY TT030 is 3.06

To sum up your sporadic infos:

Lyndon Amsdon EtherNEC
MAC adress reads as FF FF FF FF FF

>you got me ip stack

I suppose you are using STinG?

I have a TT with EtheNEC and STinG and it works but I had to do some tweaks to get it running. (EtherNEC has however lately started to act strange here, possibly because I have used the TT too much or something...)

Use ENEC.STX (not ENEC3.STX).

Set ENEC.STX to load and allocate in TT RAM by altering the program flags. Some desktops can do this but if you are using the built in desktop you need some application to change them. Sorry I use the desktop so I have no app name to give...

Check that ENEC.STX is the physically last program in the STING folder. When STinG launches it puts the driver names on screen and if the EtherNEC driver appear last you are fine.

EtherNEC has problems with some TT's. Probably timing problems? On another TT here I only got it working with TOS and not Magic. On this TT it works (actually worked) fine with Magic but not with TOS.

I have a third TT with the older Genius LAN parallel port EtherNet and it runs fine all the time as my webserver. Guess it's time to power it down soon and check how EtherNEC works with that...

A month ago the TT I'm writing this on started to have problems with EtherNEC if I _reboot_ or turn it completely off and start it again warm. If I leave it overnight it starts just fine. Sympthoms are no connection and wrong or no MAC address. I actually did shut it down for an hour today and now I'm working with the rather strange MAC address 6a6a6a6a6a6a! (Checked from my router's arp table.)

This means I lose my Internet connection if I have to reboot but fortunately this TT runs very stable...

Did some tests earlier today and booted into TOS and managed to get the correct MAC there (but not with Magic) using both ENEC.STX and ENEC3.STX. PingpPackets got out but all dropped on return.

I have some time ago actually got it working with TOS when the computer had been on for really long and at that time EtherNEC refused to work with Magic. STinG configuration remained the same.

I have full control over file contents here (backups in four generations plus an older reference backup) using checksum validation so it's really something with the hardware that changes.

(I realise you may not have use for all this info but there are others who have TT's and EtherNEC...)

And... try to learn about proper news posting using quotes and not place your own comments at the top. As you may be a newbie in newsgroups I answered you anyway... A post with lazy layout deserves a lazy answer or none at all...

> > TT030 192.168.255.1
> > XP 192.168.255.2
> > Any clues would help.

To add to all the rest:

Once you get a proper STing init, with the proper MAC address showing in your
STing CPX,
these are some things I learned along the way:

1. Before my Windows XP box will pay any attention to anything non MS on my
LAN, I had to do manual ARP entries on the XP box.

I.E. arp.exe -s 192.168.1.8 00-00-1c-1c-37-a5
^^^^^^^^^ ^^^^^^^^^^^^^^^
IP for ENEC Mac Address for NEC Card

2. Your TCP/IP settings do make a difference. Particularly the RWIN value. I
understand that if it's too big, the NEC card's buffers can overflow. Here's
how I've been taught to figure optimal values.

First find out what the suggested MTU is for your router/ISP.
Use that setting in STing for MTU.

Now subtract 40 from this MTU value.
Set Maximum Segment Size (MMS) to this.

Finally, multiply the MSS value by 3. (You might also try 4, but that's getting
close to the card's buffer limit, 2 or 3 should be very safe and perform well)
Set the Recieve Window (RWIN) to this value.

The main thing here is the RWIN size...if it gets too big, buffers in the NEC
card can overflow.
Keep in mind that taking the time to set this properly can indeed make alot of
difference in speed/performance.

In summary:
MTU = Maximum Transmission Unit: Typically 1442 or 1500 over broadband...ask
your ISP for their recommended MTU and match everything your lan to this, or any
variant evenly divisible.

MSS = Maximum Segment Size: This is your MTU minus 40.

RWIN= Recieve Window Buffer Size: The Receive Window (RWIN) value is the maximum number of bytes of data that can be buffered, pending the receipt of an acknowledgment packet back from the sender. Typically, the RWIN value should be a multiple of 2-10 times the maximum segment size (MTU-40). I recommend a multiple of 2 or 3 with the NEC2000 Ethernet card.

Hope this is helpful,
Brian

> Ups, i see. German manual talk about differnt methods of fitting?
> 20 wires soldering to CPU, TecBridgeBus, TecBridgeCPU?

Is this a TOS 2.6 upgrade?
If so, where does the rest of the board go? Can you tell by your instructions where to fit the board so the 68000 can see it?

I got something similar in my Mega ST (Wizztronics Compatability II), and it works like so:
Take out the origional CPU solder in the board and plug the CPU back on top (it's basically a set of extension rails and a PCB with the TOS chips on the underside.). It can also be installed by soldering it onto the 68000 piggy back.

The part that sounds similar to your board, is the one lead wire. In the case of the compatability 2 board, this wire goes to pin 22 on the U9 ROM socket (The front most ROM socket on the right side).

There's a couple of ways you can do this.
1. You can pull the old TOS ROMS out all together, and just have TOS 2.06 onboard.

2. You can bend up some pins on the front two rainbow tos roms in the mother board, fit a few wire jumpers and a switch, and have a machine switchable between whatever ROMS are in your mother board and whatever is fitted in the Compatability Plus board. If your TOS board has extra pads to wire in a switch, then it's bound to work something like this:

Remove the Rainbow TOS chips U9 and U10 (remember where they were). Bend up pins 20 and 22 on both chips. Reseat them in their sockets, taking care that pin 22 on U9 doesn't make any sort of contact with your mystery wire. Next connect the two bent up leads for pin 20 together with wire. Also connect pins 22 of the two chips together. Now run a wire from pin 22 of either ROM to a convienent ground. Finally, if your TOS board supports a switch, you'll run a wire pin 20 of either ROM to the TOS Expansion board. Finally, you'd wire the switch to where ever it goes on the TOS expansion board.

Another thing it might be...
If not all Megas, I know REV 5 at least, has some sort of patch soldered on the side of the M68000 with a wire that runs close to the left side of the expansion slot. It could be that your TOS board has the patch built in to replace the old one. In my case, I did have to reinstall the CPU patch to the CPU as it was before. The 'mystery wire', I believe is either a power source, or a ROM enable/disable signal, and had nothing to do with the Mega CPU patch.

It's a very good chance that your mystery wire goes to pin 22 of U9. If you have not bent out any ROM pins and jumpered them together, etc....then you'll

need to REMOVE the old ROMS to try this hook up.

Hope this helps,
Brian

Bonjour Jean-Luc.
Nice idea I will try that and I will drop you a line
just got off nightshift only a few more days to go.

Aurevoir john

80. Re: TEC Card HELP!!

Newsgroup: comp.sys.atari.st
Date: 2004-01-05 07:39:44 UTC
From: Richard Anderson <rganders@pacbell.net>
Message-ID: <4x8Kb.6328$QI5.4786@newssvr29.news.prodigy.com>
Source record: 21869

Don,

I have a TEC card from CodeHead Technologies in the US a long time ago. I have found the docs on it, and looked through it. The only special connection for an individual wire that is documented is for a modification to allow switching to your original OS.

CodeHead sold this mod in three versions. The first (standard) has a 22 wire ribbon cable that has to be soldered to pins of the CPU or pins of the Mega's expansion connector. The second (CPU bridge) plugs into a motherboard with a socketed CPU. The third (Bus bridge) plugs into the Mega's expansion connector. All three have a ROM socket connector that plugs into the socket for the first high-byte ROM (U9 on the Mega, U4 on others).

I believe I have the Bus bridge version, but I would have to open up my system to check.

Have you tried pinging the loop back address (127.0.0.1) to see if tcp/ip is OK? your range of 192.196.255.XXX is a completely valid class C ip, so that should be fine. The request time out? I'm having a little trouble understanding you? Also, what subnet mask are you using?

Mark

No, this is the file I already have, and the sources here is not the
driver itself, I think :/

Thanks anyway.

Hi All!

Just to let everyone know that my Atari Pages have moved from Zetnet to Atari.Org.

Please therefore update your bookmarks to use http://jfhaslam.atari.org/

This address has been usable for some time, but it was pointing at my old address on Zetnet. Now the site is hosted by Atari.Org.

Thanks to Anders Eriksson for letting me in! :-)

Hi all.

I am trying to transfer data from my PC to my TT but cannot read the data using TOS (3.06). I have managed in the past to read these disks with Magic but I no longer have that installed. Is there a utility which will solve the problem, or is there a configuration of my HD Driver (Ver 6) which needs to be adjusted?

Thanks

Well I like EBAY.. i got a nice Mega STE from Germany..total cost in
US Dollars Inc shipping from there was $300.00..now show me an Atari
dealer who has a Mega for less then $500.00 (with 4 mb memory and 80
meg HD) also tac on shipping cost. I looked and Ebay was my best
option..besides it up to the BUYER what a fair price is..If its too
much don't bid

Hello Mark.
At the moment I will not be able to touch my computer as I
am working nightshift. But my information for XP Windows ip address is
192.168.255.2 subnet 255.255.255.0 . When I tried pinging from XP Run I
got on my display "Request time out" several times down the screen. What
I can gleam from the replies it may just be a software problem.

regards john

This is the first time I've poked my head around in the comp.sys.*
hierarchy for several years, and I must admit that the death of the
c.s.atari.advocacy and c.s.amiga.advocacy is quite sad. At one time,
those were the most entertaining groups on usenet. Does anyone else
remember Sinclap, Marc Barrett, and Lord Thanatos? Those guys
provided some pretty good laughs :) !

Oh well, enough of this nostalgia trip, time to get back to the real
world ;) .

* Chexxon

PS: It seems that usenet in general is a calmer place than it was
5-10 years ago, I guess due to the ascendency of the World Wide Web.

PPS: I wonder what Sinclap is up to these days. Is he still
continuing his crusade against the Jack Tramiel, the Jaguar, and
everything Atari?

PPPS: The alt.music.* hierarchy is also dead :(

>
>Assuming a /24 netmask (ie. 255.255.255.0), these are perfectly valid
>addresses. What makes you think otherwise?

I sort of remember reading it in some RFC or another. I do not have the RFC collection or any tcp/ip manuals handy now to check, that would have to wait until I got back to work after the holidays (currently being Christmas around here), but I do have a (rather old) tcp/ip tutorial text originated at Rutgers University, which -does- say that both "255" and "0" should be avoided in any of the four octets of a network or host address, because they are reserved for special use, translatable in human terms roughly as 0 = this/unknown (network) and 255 = all/any (hosts/networks).

However, that not being an official document, I will allow that it may be in error- but it makes sense to me, as, e.g. class B range is defined as 128.1 to 191.254. and class C range 192.1.1 to 223.254.254. - i.e. "1" and "254" not "0" and "255". Besides, if, for example, 192.168.1.255 would be an address mask for a broadcast within the limits of a 192.168.1. (private) network, AFAIK it is permissible to specify an address mask 192.168.255.255 for a broadcast that would reach as far out as a complete set of interconnected 192.168. private networks- and then it would not be possible to differentiate between a broadcast and a 192.168.255 network. Or maybe it is more for the benefit of human operators than computers themselves (i.e. avoiding the use of some values in order to make the addresses and masks more readable?)

It may also be that different implementations of tcp/ip differ in their treatment of this- and some other items; AFAIK in tcp/ip of DOS/Windows one does not have much choice in specifying broadcast masks, and on the other hand. for example, TCPIP of OpenVMS insists on specifying an explicit broadcast mask when defining each network (off-topic, I also remember that once it took me a lot of persuasion to convince the DNS in Windows NT4 to use a corrent reverse-lookup zone for e.g. 192.168.25.128/26 subnet- it insisted on automatically creating 25-168-192-in_addr... etc. instead of 128-168-192-in_addr..., even though all the subnets and their masks have been correctly defined in the routing table, and the same zoning worked perfectly in DNS of OpenVMS TCPIP).

I've been led to believe/practice this as well.
Most software I've used does allow you to 'assign' your preferred broadcast and unknown octets, it seems pretty common to reserve 255 and 0 for these purposes...and more often than not, routing tables I've run into are set up this way.

Brian

Hi Djordje, according to Cisco (I completed both the Netacad and CCNA this year), that is fine, as long as the last octet is not Bcast or Network. So 192.168.0.1 to 192.168.255.254 are valid ranges for class C IP's. Cisco also say that you should never use the first or last subnet. Thought the RFC say you can. Although this is a different situation:-). Most people use 192.168.0.1-255. But ,by your definition this would be invalid too, because the third octet is 0. It is the first 2 bits of the octet that determines the Class, http://www.faqs.org/rfcs/rfc1918.html seems prety good as an explenation.

> Is it really loading into fastram? And is this okay?

When booting from hard disk HDDRIVER will reside in ST-RAM since ST-RAM
is provided by TOS during the boot process, not TT-RAM. You cannot
influence this.
When starting HDDRIVER manually you can influence where it is loaded by
changing the program flags in the program header. I do not recommend
this, though, as this might lead to problems. In general you should
assume that if HDDRIVER allocates ST-RAM there is a good reason for not
using ST-RAM. Some hardware (ACSI in particular) does not have direct
access to TT-RAM at all, for instance, so ST-RAM must be used.
By the way, if your ST-RAM does not work reliably other programs, or
even TOS itself, will also fail, so you cannot use a machine with broken
ST-RAM anyway.

With current versions of HDDRIVER
(http://www.seimet.de/hddriver_english.html) you can partition a ZIP
media so that without additional software (except HDDRIVER) it can be
used with Windows and TOS.
By the way, I cannot find you in my database of registered users. Can
you please send me the serial number of your HDDRIVER?

98. SCSI PCMCIA Card Reader

Newsgroup: comp.sys.atari.st
Date: 2004-01-07 07:53:54 UTC
From: jdplace@REMOVESPAMadelphia.net
Message-ID: <mWOKb.1649$IE.1363821@news3.news.adelphia.net>
Source record: 21887

I purchased a SCSI PCMCIA Card Reader (Litronic Argus/2102) for the purpose of setting up a silent ST for music composition. I'd like to be able to use compact flash memory for "hard disk" space. Are there drivers available that will allow an Atari to see this as a drive? The device shows up at boot and on a bus scan with HDDriver, but it does not show as a drive. Any ideas? Anyone else doing this?

TIA

Ahem,

Maybe I'm jumping the gun, but I wish you luck ;-) OTOH if it's scsi it
should be somewhat standardized if you plug standard memory media into it.

Thanks,
Mark

Hi,

I use the EtherNec interface with a Realtek RTL8019AS chip on board.
I use the STinG 1.26 installing.
The ftp transfer from my iMac to my Falcon with aFTP 1.55 is fast, but the transfer from the Falcon to the iMac is very slow (round 7 KB/s)
Why this? Any ideas?

ciao, Bernd

Did you create partition on this device? I do not see a reason why the
read should not work with HDDRIVER, provided that it is fully compliant
to other direct access or optical memory SCSI devices.

Source record: 21895

Hi Joseph

I use an Adtron Accent SCSI PCMCIA Card Reader with my CT2b Falcon. It shows up on a bus scan as having 2 LUNs 6.00 & 6.01 which I take to be the device and its card or something.

Jinnee then automatically recognises it and places an icon on the desktop. Adtron do tell you NOT to have a card in the slot when booting, but to put it in later, ie when the desktop appears. I found this to be correct as I got strange effects on file transfers if the card was in. Also I have to use GEMDOS mode in Kobold otherwise I lose data or it freezes whilst copying more than 2 files! I think because it is the last device in the chain I get termination problems too which are solved when I switch on the CDRW drive - don't ask me why!

But for reading CF cards from digi cameras it is essential. I have tried to load pictures from the card directly into say PhotoTip but there seems to be picture loss (thats why I copy them to disk first). Some programs can run directly, I tried GEM Pacman it seemed to work OK.

Hope this helps you!

Neil :-)

The device does not show up under partitioning (or as a drive) so I
think it may not be a standard device. It's really designed to read
a "Fortezza" secure token for email security. I was just taking a
chance that it would work this way. I have found in searching old
messages that there are other brands of readers that do work with
HDDriver or BIGDOS.

Thanks,
Joe Place

HDDriver does not see the device as a drive, nor does the desktop, so
I don't think this is a standard card reader. I may have to look for
a different brand of reader. Which ones have you found to work?

But the devices shows up on a bus scan and when booting, as you said in
your initial posting? This is strange since it means that the device is
SCSI compatible except for reading sectors, which is very strange.
You should not yet give up but use SCSI_MON
(http://www.seimet.de/atari_english.html) to find out what's going wrong.

>the third octet is 0. It is the first 2 bits of the octet that determines
>the Class, http://www.faqs.org/rfcs/rfc1918.html seems prety good as an
>explenation.

"Classes" are obsolete since the introduction of CIDR. All that counts is
the netmask you use on your net - it is perfectly valid to use a 10.*
address with eg. a /24 (255.255.255.0) or /12 (255.240.0.0) netmask, as long
as all your machines are configured the same (which is always required for
IP to work).

When using 10.0.0.0/12 as a net, 10.0.255.255 is a valid, non-broadcast
address - 10.15.255.255 would be the broadcast address in that case. An IP
implementation that confuses 10.0.255.255 in this case with a broadcast
address is simply broken, and will not be able to reliably communicate with
other, conforming implementations, since there are special rules regarding
broadcast packets.

Yes and a big Sieg Heil to you too.

I don't know what brought on this rant, but I don't think Bruce had any
intention of emigrating to the UK.

I already knew racists were stupid enough to blame all foreigners for
their own problems, but even jumping on someone when he says "I'm in
Chile" is even more stupid than I'd ever imagine people like you to be. :)

What I fail to see is what your nazi talk has to do with eBay or Atari.

Have you got one final excuse before I post a complaint to v21?

Maurits.

Er...isn't the Xbox hugely outselling the Gamecube?
Jeff has a history fraught with consoles that he wrote stuff for that didn't make it big, like the Konix (which sounded great) and the Jaguar of course (which we all know *was* great). The minute I read about him leaving development of Pocket PC "Super Gridrunner" for the Gamecube I felt a little sorry for him.
I do hope I am wrong and that Gamecube sales are sound despite the Xbox selling more.

124. Brand New Falcon

Newsgroup: comp.sys.atari.st
Date: 2004-01-08 23:18:58 UTC
From: Richard Kilpatrick <richard@dmc12.demon.co.uk>
Message-ID: <sdWDPIAATe$$Ew4W@btinternet.com>
Source record: 21813

So...

What am I likely to expect in this box?

Our local car dealer got chatting to me about old computers (there's an old PC lying in their workshop, and has been for 4 months; I asked if it was going to be chucked out as I want to make a smoothwall box and could also use the monitor if it's SVGA), and he tells me that a few years back, he wanted to do music.

He searched the country high and low to find the computer he'd been told was best for music - an Atari Falcon. Reckons it was 8 years ago, the last one he could find anywhere. Paid ï¿½500 for it. He did also say 1040, so I wasn't sure, but he insists it's a Falcon and I believe him on that point.

Bought it, tried to use it, put it back in the box, and hasn't touched it for 8 years. It is apparently complete unupgraded, as new, still in the bag.

Needless to say, I made him a fair offer (before anyone either thinks I tried to rip him off, or missed out on a bargain, this dealer has been so brilliant with our 5 year old, almost trade priced car doing at least ï¿½1,000 warranty work on it - there's no way I'm risking the karma of telling him it's worth a tenner ;)), which he thought was a fantastic offer (so the tenner may have been feasible!), and I should have it next week.

Did any Falcons ship without HDs, and do I need to be finding a new mounting kit? I know Lyndon sent me stuff for my last, rather more 'complete' Falcon system, but I'm loath to even touch the screws on this one. If it's really a brand new, essentially untouched Falcon, it would be nice if it stays that way.

Also, whilst I'm not disclosing my offer, what do people think it's worth? I see two Falcons completed on eBay recently and one active, one badly described Italian one for ï¿½125 reserve not met, one US system with the proper Steinberg hardware for $300 reserve not met (I'd once have willingly paid that for the Steinberg kit), and one currently at ï¿½35 equivalent on ebay.de with Midex interface and monitor.

Richard, looking forward to getting a Falcon again.

I don't know about in Europe, but right now the GameCube has been outselling the Xbox and holding it's own against the PS2 lately. Much of that is most likely due more to the big price drop than anything else, but the GameCube has sold quite well. In comparison to the last console that Jeff developed for (the Jaguar), the GameCube is by far and away a better selling system.

For Sale:

Yup, an ancient Atari laser printer, SLM 804. Yours for $10. It's
been unused for a long time, but was working perfectly when last
unplugged. If you have any interest, and can pick it up in the
Washington, DC metro area, please email progster@hotmail.com or call
301-345-1548.

129. How to get a CT60 running MiNT and other questions.

Newsgroup: comp.sys.atari.st
Date: 2004-01-09 02:43:55 UTC
From: ekaljuma@mtsac.edu
Message-ID: <926a9946.0401081843.34afec73@posting.google.com>
Source record: 21818

Hello everyone,

I haven't browsed this group for the better part of three weeks. During this time, I actually got my CT60 running (Thanks, Mark!). It was a harrowing experience cutting the chip leg without destroying the board, I'll tell you! As usual, success begets yet more questions, so here goes:

1. Where is the current "newbie" FAQ for MiNT? I'd like this machine to be MiNT-based, unlike my other Falcon which runs Geneva/NeoDesk. (BTW, Geneva/NeoDesk run quite well on the CT60.)

2. What happened to text reading on the CT60? When I double-click on a file, I get a white screen. Pressing "Q" gets me back to the desktop, but I'm having to run Edith to read my configuration files.

3. Did anyone get the NOVA adapter working? 640x480 is getting mighty old.

4. Wizztronics recommends that the lower shielding be retained when moving the motherboard. Does anyone know why? I didn't keep mine, and I'm wondering if that might be a reason for some instability.

5. What are the relative advantages of copying TOS to SDRAM (the default) versus not (Control-Shift at bootup)? Leaving TOS off the SDRAM seems to be a bit more stable, but I haven't done enough testing to be sure.

6. Are there any know "port" issues with the CT60? I haven't tried printing, scanning, or modeming yet. (The IDE HD and the SCSI CD-R work quite well).

Happy new year to everyone! Although the CT60 isn't quite stable yet (I get far fewer crashes now, but the darn thing reboots on me occasionally and I can't figure out why), I'm looking forward to my 66Mhz computer with 256Mb of RAM and a 3.1Gb hard drive. I can load JPGs with ImageCopy 4 over three times as fast! (Can't type any faster with it though.) :-)

I'll try SCSI_MON. When I select ID CHECK in HDUTIL it lists my
drives as DIRECT ACCESS, and the card reader as PROCESSOR like the
Falcon. Could this be the problem? Also under CONFIGURE DEVICES,
none of the options are selectable for the card reader.

Thanks very much,
Joe Place

Yes, a few Falcon's did ship with out a hard drive.
Even fewer shipped with a 1meg memory board.

The standard factory configs were:
4meg RAM, 80meg Conner IDE Hard Drive.
14meg RAM, 80meg Conner IDE Hard Drive

You should be able to tell which Falcon you have at boot.

There is a memory test at boot, and if there is a hard drive set to boot, you'll see a list of all IDE/SCSI devices connected.

Also keep in mind that when your friend called to order the machine, he may have coustomized the order in some way. I.E. Purchased a larger HD from the dealer, or an after market memory upgrade, etc. Seeing as he purchased the machine for music, he may have had the SCSI and various CAF patches done to the mother board. If not, they are HIGHLY recommended. In many cases the audio portions of CuBase Audio are nearly useless without the SCSI patch. An alternative is to use a system for audio that will work with IDE (SoundPool, Softjee, etc...). Other CAF patches involve the analogue audio circutry...one buffers the inputs for line level input. One removes the bass boost circutry (not such a good thing for serious audio work).

An alternative to having these 'audio' patches done is to use external DSP port units like the Soundpool FA4/8 for D/A conversion (hooks to the DSP). Jam In, ADAT-FDI, or S/PDIF-FDI for A/D conversion. These units just plug right on the DSP port.

> equivalent on ebay.de with Midex interface and monitor.

I figure the going average rate at popular auctions is between $400 and $700 US, depending on the config and what other goodies might come with it. Dealers with 'new stock' tend to ask between $700 and $1,200 US. Also, used Falcons from 'dealers' tend to be $700 and up...but keep in mind you'll be assured it is tested and in a refurbished state, and may have had Atari/approved patches and modifications, or after market additions.

The CuBase package you speak of is still under reserve AFAIK. The Midex + is a pretty rare item! I'm guessing it's worth between $150 and $200 U.S. Keychange is likely to still have a few of these for sale. The CuBase 3 is worth that again....between $50 and $200 with an auction average somewhere in the middle. Keychange has most if not all versions of CuBase for sale.

If you need CuBase Audio Falcon and can not find it anywhere, contact me, as I have a spare english version with CAC that I might let go.

Brian

Message-ID: <slrnbvsta6.qp3.atari@core.preferuje.luzik.pl>
Source record: 21822

On 8 Jan 2004 18:43:55 -0800, Galen <ekaljuma@mtsac.edu> had a noticeable pleasure while writting:
> 1. Where is the current "newbie" FAQ for MiNT? I'd like this machine
> to be MiNT-based, unlike my other Falcon which runs Geneva/NeoDesk.
> (BTW, Geneva/NeoDesk run quite well on the CT60.)

The best thing to start with for begginer is EasyMiNT distribution.

134. Re: Brand New Falcon

Newsgroup: comp.sys.atari.st
Date: 2004-01-09 10:17:29 UTC
From: Richard Kilpatrick <richard@dmc12.demon.co.uk>
Message-ID: <yk0UhlDI9n$$EwpB@btinternet.com>
Source record: 21823

In message <5ZqLb.5764$CM4.1887@bignews1.bellsouth.net>, Brian Roland
<BJRoland@bellsouth.net> writes

>Yes, a few Falcon's did ship with out a hard drive.
>Even fewer shipped with a 1meg memory board.

As in, only 1Mb RAM? Yikes.

>The standard factory configs were:
>4meg RAM, 80meg Conner IDE Hard Drive.
>14meg RAM, 80meg Conner IDE Hard Drive

I'm guessing it's a factory untouched 4Mb version - he complained that
it didn't do very much and hardly had any memory. Maybe it /is/ a 1Mb
one, hence him calling it a Falcon 1040...

I'll be very pleased if it does have 80Mb. I don't know why, but I'm
fairly sure I had to get an HD kit from Lyndon. Maybe I'm thinking of
removing the HD once, and it was just a speaker I got from him instead.

>There is a memory test at boot, and if there is a hard drive set to
>boot, you'll
>see a list of all IDE/SCSI devices connected.

nods I've owned a Falcon before, a 14Mb, patched one with a big SCSI
tower - sold it in 2001 when I got an iMac.

>Also keep in mind that when your friend called to order the machine, he
>may have
>coustomized the order in some way. I.E. Purchased a larger HD from
>the dealer,
>or an after market memory upgrade, etc.

He didn't mention that, and I think he'd remember since I talked about
HDs and memory when discussing values. I get the impression he bought it
in 1995/6, and the dealer was an Edinburgh company called Silicon (IIRC)
once based on Antigua St. - I remembered them because when I bought a PC
for college in 1991 (one of those tiny Amstrad ones with the 10"
screen), they still had a Sinclair PC200 out for sale. I get the
impression it was an unsold one, NOS, and he took it as is. The company
folded about a year later.

>Seeing as he purchased the machine for
>music, he may have had the SCSI and various CAF patches done to the mother
>board. If not, they are HIGHLY recommended. In many cases the audio portions
>of CuBase Audio are nearly useless without the SCSI patch.

I remember this. Now, I don't know how likely that is given the shop's
reputation. If some of the last were already patched, that might be
done, but it all depends on when it came into stock.

>An alternative to having these 'audio' patches done is to use external DSP port
>units like the Soundpool FA4/8 for D/A conversion (hooks to the DSP). Jam In,
>ADAT-FDI, or S/PDIF-FDI for A/D conversion. These units just plug right on the
>DSP port.

nods

I am interested in this aspect of the Falcon, but I have a Mac G5 with
RME Multiface, Logic Platinum and SoundDiver beta, and Steinberg Midex8.
I can't justify spending the amounts (quite justifiably, in many cases)
asked for these devices - the cost of getting this stuff is partly why I
abandoned the Falcon in favour of the Mac. No doubt one day, I'll get to
play around with a suitable system, but it's not a priority now.

>The CuBase package you speak of is still under reserve AFAIK. The Midex + is a
>pretty rare item!

I know!

But there is no reserve on the active auction I found.

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=2778493851

It's currently at 88 Euro with 3 days to go, and consists of the Falcon,
Midex+, key, Cubase etc plus SM-124.

Not many Falcons around on eBay, at least that I can find.

>I'm guessing it's worth between $150 and $200 U.S. Keychange
>is likely to still have a few of these for sale. The CuBase 3 is worth that
>again....between $50 and $200 with an auction average somewhere in the middle.
>Keychange has most if not all versions of CuBase for sale.

Again, whilst I'd like to use it, I can't justify spending on it - good
as the Falcon is, I doubt it would be as easy to use as Logic on a Mac
with 20" screen.

> drives as DIRECT ACCESS, and the card reader as PROCESSOR like the

So the reader does not implement the SCSI direct access device protocol
(like hard disks) but has a special SCSI-command set. You will only be
able to use it with special software, that knows about the
vendor-specific SCSI commands it uses.
It is possible to write software that uses HDDRIVER's SCSI driver
interface to access the reader, but this requires knowledge about SCSI
in general and the vendor-specific commands for this device in
particular. No use in trying IMO.

Really faster in SDRAM, sure ! Copyback mode of the caches is only possible
on SDRAM accesses, not on IO or ST-RAM.
On IO and ST-RAM the cache mode is Write Through...

> 66Mhz computer with 256Mb of RAM and a 3.1Gb hard drive.

To be stable, you have to be sure that you have no bad software running.
Try to boot with TOS please and the minimum config from CT60 package (CPX)
and a NVDI 5.
If you have no more crash running software from this config, I can assure
you that your problems are coming from your alternative OS installations.
At 66 MHz, there is no reasons that a CT60 is not stable !
I'm sure of that ! The only problem may be a 060 not accepting overclock at
66 ! It is very rare but possible.

Regards

Rodolphe

It is the same thing for me between my Hades/STe and my wife's PC.
The ftp server on my wife's PC has an option for a fast/slow
connection. If I use the fast, data streams from the PC to Hades,
but if I use the slow option, it goes about the same (7-10kb)
speed when I transfer from the STe to my Hades.

I had heard that TT owners were having trouble with the
NEC2000/Sting setup. I got it working fine on my STe. A big factor
in getting everything to work is the Route.tab setup. What does
yours look like?

In my case, GCC is highly regarded as one of the world's best memory tests. When you receive internal compiler errors on an otherwise stable system, it's evidence that GCC is thrashing RAM around and getting 1 bit wrong every so often, especially under heavy optimization. This is what is wrong with my falcon. Generally, it runs just fine. Every now and then that "bad bit" will cause a terrible crash, but most times it's just an annoying hassle causing random compile errors in one source file out of 20 (big gnu projects).

I believe it's my Falcon's motherboard, but when Keith Scroggins and I get together to test this stuff, I'll figure out the defective component and send it to you for your analysis. I'm extremely highly suspect of my falcon motherboard by the way, not the CT60, and not the st-ram board(s) since all of them exhibit the exact same problem. Unfortunately I do not have another DIMM with which to test. I would think gcc would be using only the SDRAM and hence it wouldn't be subject to poor ST-ram problems. If that's the case.. HRMM! But wait, the same types of crash occur in 030 mode using ST-ram only. Also occur in 060 mode using st-ram only. So obviously MiNT must make some use of st-ram even with an abundant amount of SDRAM available - I think disk caches are getting corrupt!

In the mean time I plan to remove my bus overclock. I'm running at 16MHz anyway since my system has increased instability at 20MHz. Maybe my clocks just suck, or maybe my soldering sucks ;)

I have gone through my software and configs with a fine tooth comb. I've tried every combination of settings. My falcon is absolutely as stable as it ever can be with the current setup, plus this similar setup works perfectly under Aranym.

Despite all the problems I have had with Atari's dodgy hardware in the past, and the worse problems that I am having with it now, I'm still interested. I still keep trudging along. I still keep trying. That's really something to say for the charm of these machines. Anything else would have been long tossed in the nearest garbage pail (including several x86 pcs!). I really have the highest hopes that every single CT60 falcon out there works perfectly in the end for years to come! Maybe I'll get a 100MHz cpu if we ever find some.

Thanks,
Mark

You're in the UK, there a fair price for a brand new falcon would be 200UKP I think. They're really quite rare, especially a virgin one. I've personally had my way with my falcon many times. Falcons go for rather small amounts of money in Poland and Germany though so it really depends where it's sold. I suspect that once my CT60 falcon is perfect, with all accessories I could pull nearly $1200 for it from the right buyer. But seems nowhere is more expensive than the UK looking at exchange rates.

Thanks,
Mark

> but if I use the slow option, it goes about the same (7-10kb)
> speed when I transfer from the STe to my Hades.

But what's the problem?
A timing problem in the EtherNec driver? Or it's a hardware problem?
We need a answer or a bugfix now. The slow download rate is very pesky
:-(

Btw: What for a type of ethernet card do you have? And what for a chip
is onboard?

Ciao, Bernd

Hum, If there is a problem in 030 mode (16 MHz), it is sure that is will
here and maybe worst in 060 mode with 16 MHz or 20 MHz bus.
With 030 mode the problem is here, so the CT60 is not the problem.

A bad clock problem may be here, what may explain that it is worst at 20
MHz...
The first thing I think is the ST-RAM !
What are you using as ST-RAM card ?

Send me the falcon mb and I will fix that...

149. Anyone considered porting Open Office?

Newsgroup: comp.sys.atari.st
Date: 2004-01-09 22:33:38 UTC
From: mail@freeman-studio.com
Message-ID: <5c1cf651.0401091433.3dc77d7b@posting.google.com>
Source record: 21838

Hi!

I heard about the "Open Office" project from a friend of mine and thought I'd check it out. It looks extremely cool! For those who don't know, it's a MS Office-compatible office suite that's completely free and open source, designed to be ported to any platform. It has a word processor, spreadsheet, database, presentation program, and drawing program, all able to load and save MS file formats, as well as others. They've got just about every mainstream platform out there porting it (Windows, MacOS X, Linux, FreeBSD, etc).

I was just wondering if anyone had considered trying to port it for high-end Atari's (like Medusa/Hades/CT60/Aranym machines). It needs a 64Mb system, so that leaves most Atari-made machines without upgrades out of the picture, but I would imagine it would help give people a good reason to start buying the newer machines and upgrades. While we do have software that can work with images, Word files, and *old* Excel files, as well as more generic equivalents to the basic WP/Spreadsheet/Database/Drawing software, we don't have any kind of presentation software (like powerpoint) at all, and we don't have anything with the features that Open Office has (like saving any document as PDF by pressing a button on the toolbar, or saving Flash files from drawings and presentations). If it's possible, I think it'd be a good thing to port to our platform as well. That said, I don't have any experience with the porting process, so I may be barking up the wrong tree here. Any comments?

The Open Office web site is: http://www.openoffice.org/

>in getting everything to work is the Route.tab setup. What does
>yours look like?

A proper EtherNec ROUTE.TAB with a "broadband router" acting as the
default gateway with ip address 192.168.0.1 looks like this:

0.0.0.0 0.0.0.0 EtherNet 192.168.0.1

with nothing but TAB characters (no spaces!) and EtherNet spelled exactly
the way I just did.

EtherNec behaves really strange om my TT now... When cold (not used for a
couple of hours) it reads a MAC address but misses badly as it now uses
"2a:2a:2a:2a:2a:2a"! But the connection works perfectly.

If I reboot after a short time I get another MAC (usually 73:73:73:73:73)
and my switch gets a little confused and sends out packets from the TT to
all other computers (all LED's blink) but the connection is still fine!
If I reboot after a long time I get ff:ff:ff:ff:ff:ff or
00:00:00:00:00:00 and no connection. All this with Magic and it has
worked perfectly for over a year and just started to behave like this
before christmas... No difference if I do a full power down reset btw.

And now comes the really weird thing: If I boot into TOS or Geneva
EtherNEC reads the MAC address perfect all the time but I get no working
connection! All LED's blink but all I get back is dropped packets!

Guess it's about time to resort to how I did things before I got EtherNec
and have this TT on a nullmodem subnet under the other TT which have a
working parallel port Ethernet adaptor...

I use the EtherNec interface with a Realtek RTL8019AS chip on board.
I use the STinG 1.26 installing.
The ftp transfer from my iMac to my Falcon with aFTP 1.55 is fast, but the transfer from the Falcon to the iMac is very slow (round 7 KB/s)
Why this? Any ideas?

I'd bet a fiver that it's the client you're using.
With ga-ftp for STing (the plain ttp unix port) I get rates way up into the 20,000 to 50,000 cps range.
With AFTP (the cool GEM client) it's only around 5,000 cps. A BIG difference, and I have no idea why AFTP is so much slower. CAB also performs much much faster than the AFTP.

Try some different clients...

Brian

A long shot, and maybe 'over simple' but it has happened to me more than once.
My EtherNEC came mounted in a generic hobby chassis with a slot cut for the
ribbon cable. Sometimes the cable gets tugged a little to hard and thus the
connection from the ribbon bridge to the ISA adaptor isn't what it should be.
So....I open the little black box, make sure the card slots are well seated, and
presto....things run smooth again.

It may be worth checking this out.

Brian

153. Getting a different TT/Falcon GUI?

aFTP 1.4b4 is very fast. But aFTP 1.55 have a problem with slow transfer
rates :-(

> Try some different clients...

The second problem is the 'FTP Server' program off Vassilis
Papathanassiou. This program has the same problem like aFTP 1.55 and
this in STiK *and* MagiXNet version. Like aFTP 1.55 too.

Rodolphe,

I use the Atari 4meg card right now. Although I test with that terrible
board when in 030 mode due to not having enough ram to complete the tests
with a 4 meg card. Any way around it, the problems seem quite similar
with fastram or original st-ram... I think the disk caches are getting

corrupted, which are located in st-ram regardless. First thing is first, I'm going to remove the bus upgrade and see if it helps at all. If it doesn't I will mail to you, have you fix and reinstall the bus upgrade yourself that way I can be sure it is 100% perfect. I am trying to get a new falcon in the mean time so that I can still have a CT60 falcon while this board is out for service... That way you can take as long as you want to look at it.

One thing is for sure though, it takes a LOT of memory I/O to get errors, so it's a very intermittent, very small problem. Hard to reproduce without gcc really.

Thanks,
Mark

It's ages since I used an Atari. I find I still have some connectors and cables, which are free, except for postal costs, to anyone who can use them.

1. 25 pin male to 25 pin female connector (booster) for laser printers (made by C. P. Rossiter of Nottingham).

2. 9 pin male rto 25 pin female connector.

3. 15 pin female to 19 pin female connector.

4. 25 pin male 9 pin female cable.

I believe that was all that Atari made (I think you could get some with smaller HDs), any others (i.e. without HD) were changed after they were built by some outlets to try and make them cheaper. No HD made them pratically useless, so you ended up buying the HD that was taken out plus the braket.

Early Falcons were 65Meg Hard drive. There are also 3 Revisions of TOS as
well. 4.01, 4.02, and 4.04. The early 2 were bloody awful. I have both a
4.04 and a 4.01 Falcon. TOS 4.04 even uses less ram than previous versions.

164. 1040 STe diagnostics

Newsgroup: comp.sys.atari.st
Date: 2004-01-11 03:08:29 UTC
From: Ryan Underwood <nemesis@icequake.net>
Message-ID: <pan.2004.01.11.03.08.28.676245@icequake.net>
Source record: 21753

Hi,

I just unboxed a 1040 STE of unknown origin. It came with a generic "multisync switchbox" and some diskettes. Well, I haven't a RGB monitor handy nor a VGA that will work at the ST medium res, so I wired up a composite cable to the lead of pin#2 and gnd inside the switchbox. (It's my only 13pin cable...) I also floated the mono detect pin (4). Booting up the ST, I see a green power light, an all white screen, and what appears to be floppy access, but nothing else happens. What should I be seeing here? (this is my first ST)

FWIW, I also grounded the mono detect, and then when it boots up, on the TV it goes from a white screen to a blank screen with rolling lines (I guess that is the composite sync signal that is also on pin 2). Then I can kind of see the hi-res on my VGA monitor which I plugged into the multisync adapter, but it is also all white and nothing else happens.

From what I read, it looks like after failing to boot from floppy I should be seeing TOS. Is that true? If so, what should I look at first to try to determine what the problem is that is preventing the machine from getting to the desktop?

Thanks.

What you are seeing is precisely what you should be seeing. For some
reason unbeknownt to me the ST's take around 40 seconds to show a desktop.
The floppy will light. To get around this, simply stick any sort
of normally formatted 720K floppy in the drive and it will go directly to
the desktop.

FYI, the TV cannot show mono. Hence you don't want to do anything with
the mono detect. You see those lines when you ground that pin
because your TV can't do ST-mono - and I would think it could possibly
damage your TV. Using a TV you are limited to ST-Medium and ST-Low
resolutions which to be honest on an ST are the most interesting ones
(ST-low, games).

Yeah, but it takes a while. Like 40 seconds. Just let it sit there for
what might seem like an eternity. You'll get a desktop with floppy
A and B icons. I can't imagine any good reason you wouldn't.

Thanks,
Mark

You're only about 6 months behind the times dude!. A recent spoof in GB
involved a well known bank apparently requesting updated personal details.
Ignore anything that's not snail mailed to you.

Yeah, what I meant was the multisync adapter was grounding the mono detect
pin, so it was showing the video on the VGA port. I had to remove it to
get the video to the composite output.

You're absolutely right. I booted it up this morning, this time bit my
tongue while waiting, and there's the desktop! :)

Thanks Mark!

More like 12-18 months behind. I started receiving these "update your
details" phishes originally requesting I update my AOL details, and
these sent to a Demon user who has no AOL account[0]. Since then, I've
received multiple phishes for a variety of US and UK banks, Ebay, and
PayPal. I can't recall the last AOL phish so it looks like the phishers
may have actually done a little list validation.

>A recent spoof in GB

171. Re: 1040 STe diagnostics

Newsgroup: comp.sys.atari.st
Date: 2004-01-11 17:22:02 UTC
From: Ryan Underwood <nemesis@icequake.net>
Message-ID: <pan.2004.01.11.17.22.01.462584@icequake.net>
Source record: 21760

Now with knowing how the thing is supposed to function, I took the "multisync switchbox" which had an audio output, a VGA 15-pin output (for hi-res) and a RGB 9-pin output (I guess for low-res on a 1084S or similar). I added a composite output, an audio input, and ran a new ground wire from the ST 13-pin connector to the VGA plug since the signal ground had been broken somehow inside the cable. Now I get a 320x200 green desktop on a composite monitor when switch is in one position, and when switch is flipped to the other position, it reboots and puts a 640x400 mono desktop on my VGA monitor.

Looks like we are doing pretty good except for a few things:
1) The quality of the VGA is decently sharp now that the ground is fixed, but it is "flickery". Is this normal? The composite video is stable but slightly fuzzy like all composite video; there is no flicker to it at all.

2) When I switch from VGA to composite and back: whichever monitor is _not_ currently being displayed upon, instead of receiving nothing at all on its input, receives a messed up signal and goes out of sync. Is this the fault of the switchbox I have, or normal behavior?

3) I ran a cracktro from a diskette I got with the system. After 2-3 minutes of letting the graphics/music demo run, the ST stops with two bomb icons right next to each other in the middle of the screen, and the music halts to a solid tone. I guess this is the system crashing. (?) What are usual causes of this? There is no addons in the ST that I can see that would be stressing it. It definitely has not been used for awhile. Does the 4-inch dropfix address random bombs? :)

thanks for any info.

Hmm, to follow up here, I did the 4 inch drop and it didn't change a
thing, so I opened up the STe and found an open cap and a few with ESR
through the roof. I think my problem is located there....

173. How do I connect my ST to a TV (NTSC) ?

Newsgroup: comp.sys.atari.st
Date: 2004-01-11 19:30:53 UTC
From: mbricout <mbricout@roadrunner.nf.net>
Message-ID: <bts8eg$6eu$1@nntp-stjh-01-01.rogers.nf.net>
Source record: 21762

I am in an NTSC zone. I have a 1040 STF with a SM124 monochrome monitor. My STF is NOT equipped with an RF modulator, and TVs over here do not have the Scart (Peritel) connector. What are my options to get access to the color modes of the ST ?

I have a TV with "ColorStream" component video input. These are 3 RCA connectors labelled "cY, cB, cR". That's where I usually connect my DVD player. Can I make a cable and hook up my ST to the TV using those connectors ?

What are my other options if I want to use the color modes of the ST ? I came accross some information regarding a ST to S-Video adapter called "Video Flyer" (I think). Anyone knows where to find one ? Or an external RF modulator ?

Thanks in advance,
Michael.

174. WTB: Good condition, working Mega STe and/or Falcon030

I am interested in either or both of these for my collection. I always wanted both but couldn't afford either at the time. By the time I could, I needed something compatible with my work computer so I've been part of the PC world for well over ten years. I love my PC's but I still hold a special place in my heart for my 8 and 16 bit Atari's.

Anyone know of someone wanting to part with either of these systems that isn't wanting an arm and a leg? What should I expect to pay for either system in fair to mint condition and good working order? I've checked eBay but they've been kind of low in the ST/STe/Mega/Falcon area lately.

Thanks for any info.

Sincerely,
- Byron Followell

Well I guess he understandably assumed that only American people would be
the magority of users of Atari Computer hardware, which came from the USA.
But strangely it was the other way around! Atari computers did better in EU
then the US!!!

Best bet is to pay a arm and a leg for one when it pops up on FleaBay. They
show up every so often, there is one on there for $750 right now, and with a
buy it now for $1495! LOL

http://cgi.ebay.com/ws/eBayISAPI.dll?ViewItem&item=2780113699&category=51107

I lucked out and got a stock one back in April for $320.

And classical question : What is your HDD driver ????
I just hope you were care about that...
If not HDDriver or a to old version, it is normal you get HDD problems !
060 is running too fast.
Sure I have no explanations for 030 mode problems.

Message-ID: <1201200409585379 41%bill@nomail.invalid>
Source record: 21774

About 3 months ago I got an email from eBay containing a link to a web form to fill in personal and credit card info, and the email asked me to use this link to update my personal info.

I was leery of this request, so forwarded the suspicious email to eBay with my concerns.

Ebay came back with the admission that the email WAS legitimate and that they HAD sent the email to me containing the link. They insisted that I had to go there and do this or I would lose my account with them.

This was in spite of eBays own warnings about responding to such requests, and their claims that they would never send out an email containing a link to personal information.

I'm a frequent use of eBay but this kinda lowered my level of confidence in the competence of eBay's security department.

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

http://www.aracnet.com/~atari/shipping.htm How I can save you Money!
http://www.aracnet.com/~atari/whybuyben.htm Ben's References!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. FREE Catalogs on Ben's Domain at http://BensCatalogs.Atari.org or at http://BenSells.Atari.org Catalogs can be attached to,Requested by & Received Through E-Mail at Atari@aracnet.com or BenSells@Atari.org and Please Specify Atari 8 Bit, ST, Jaguar and/or all 3! Or Call Ben anytime at (503)256-9974!!!

Blimey, Gun, Foot, Hole, Shoot. Please rearrange to make a well known phrase
or saying.

I think the difference is that it would probably have taken you to a secure
server and was probably a certified mail. If not, Bugger that!!!

Hi Tim,

>Best bet is to pay a arm and a leg for one when it pops up on FleaBay. They
>show up every so often, there is one on there for $750 right now, and with a
>buy it now for $1495! LOL

The very first thing that someone based in the US should do when he's looking
for used Atari hardware is to take a look at:
http://www.atari-fachmarkt.de , that's the URL of the German based Peter Denk
Atari dealer. Even if there's nothing available you fancy, you can be put on
a waiting-list...

Another option is to take a look at http://www.atari-home.de , in the section
"flohmarkt", "biete...", all the hardware there is offered by privat persons.
Alternatively, take a chance and fill in an add in the "suche" section... one
doesn't need to speak German fluently, something like "Ich suche eine "Falcon",
maximum (the amount you which to spend) should do it....

If you are afraid of ordering something from Europe because you think that
you might get swindled, get in touch with someone from this newsgroup who
lives in the same country and ask him/her to round off the deal. It's not a
100% waterproof guarantee of course that nothing will go wrong, but it'll
give you at least peace of mind...

In Holland and Belgium for example Falcons and TT's are offered on a regular
base for 75-200 Euro ($100-250), there are a couple of Dutch posters here, and
as far as Belgium goes, me and undoubtedly Martin Byttebier as well are willing
to help locating one.
But whatever method you choose, anything is better then paying $750 for a
Falcon, once people start paying these silly amounts, before you know it, next
year they'll be fetching a $1000 (easily) :-/

Cheers from Belgium
Dennis

> all else...

That's a pretty pompus, and WRONG statement. Why do 'some' Europeans constantly go on about how ALL ELSE in the world think, act, and behave? Perhaps you've been watching too much snooty BBC? Not everyone posts on the news groups every day to realize the international make-up, or lack there of in a given news group. Fortunately, MOST British persons I've known are very polite and helpful in getting people on the right track, while being very understanding that when someone posts they're quite likely to forget to ask some of the right questions. A simple, "Where in the world are you mate?" would be sufficent. It's a common mistake, and I'll assure you that if one were to collect all similar mistakes on the whole of the usenet, you'd see Americans are not the only people in the world who make it. So....get the bloody chip off your shoulder man!

Now, for the fellow's question....
It's pretty rare you'll see a Mega STe for sale. Expect to pay between $300 and $400 US for a working one all maxed out with RAM, SCSI host, and HD.

Falcons seem more common, and tend to go for between $400 and $700 used in the USA, depending on configuration and what all comes with it.

Good luck,
Brian

Hi Mike,

The CT60 might be powerful enough (barely), but you are talking about
a lot of compiling. If the OSX team's problems are any indication,
it's not a trivial job.

I'd be thrilled if anyone succeeded though!

Galen

> Big mystery for me...
>
I'm pretty certain that it's Atari (i.e. Infogrammes). The sale by
JTS to Hasbro Interactive certainly included TOS. See
http://www.atarihq.com/news/1998/980310.html which references the SEC
filing form. The sale from Hasbro Interactive to Infogrammes is a
little more vague, but since Infogrammes purchased 100% of Hasbro
Interactive's stock, anything owned by Hasbro Interactive at that
point in time is now owned by Infogrammes, which now calls themselves
Atari. The only real question is whether Hasbro Interactive made an
internal transfer of the copyright to its parent, Hasbro. Since
Hasbro (the parent) did not make computer games, the only reason to do
this would be to use parts of TOS somehow in a toy or game. Frankly,
this is way beyond rational belief.

To conclude, we KNOW that Wizztronics, Best, Milan, etc. do NOT own
TOS since it is specifically referenced in the SEC filing as being
part of the sale. (They might have the right to distribute it,
though.) We also know that Hasbro Interactive had no interest in it,
and in fact released the far better known Jaguar OS into the public
domain. Hence the rights to TOS almost certainly remained with Hasbro
Interactive until its sale to Infogrammes.

Now Infogrammes used to make ST games, so there's probably someone
there that remembers what an Atari ST is. However, the odds are that
Infogrammes was interested solely in the software's copyrights, and
they may not even have been interested enough in the hardware to
notice. This happened with Hasbro, where some Atari users managed to
convince Hasbro that they had the rights to the Jaguar. (At first,
they didn't even know they owned them.)

I don't know Ben from Adam, but here's what I will say about my brief experience with him.

I wrote to ask if he had a replacement keyboard for my 1200xl. He indicated that he didn't, but offered that he sold a couple of the other XL machines or an XE system. When I emailed him back indicating that I had fixed my keyboard by cleaning it... He did something that few vendors do nowadays - he wrote back congratulating me on my success, and asked me to keep him in mind if I needed anything.

That 30 seconds he spent doing that goes a long way with me. I've dealt with plenty of vendors of electronics, on purchased from $2.50 to $25,000 (I work in information technology), and I distinctly get the impression that he cares about customer service. If the opportunity arises in the future, he will get my business.

Everyone needs an "attaboy" every once in a while... Hang in there Ben, the economy and our country will continue to get stronger and your business will pick up...

I second that notion. I will never be able to afford the actual hardware of
a Falcon and CT60 but will always use Aranym. I think Open Office would be
a terrific addition to this platform.

There are also plenty of "for sale" posts in this newsgroup from the
UK, containing no clue in the body of the message of where they came
from.

Cluelessness is everywhere.

Rodolphe,

Sorry for the response delay. My hd-driver is, of course HD-driver 8.13.
I don't think there's any software issues. I'm up-to-date with CT60
firmware updates (JTAG and ABE), and I'm even running ABE5L hoping it
might help counter the problem even though I am in 16MHz bus mode. I
recently removed my bus overclock. Problem not solved, not changed.

Hi!
I've sent a mail to you.. but i'm going to ask here as well...

Which payments methods do you take ? I'm from Chile, but the shipping would
be to a mailbox on Miami, Florida.
Paypal ?

Thanks :o)

I receive lots of that mail...
But all the address are hoaxes.... http://www.ebay.com@blablabla ... where blablabla is the real server addres..
Even your dns holder (your isp or some place between you and the isp) could be hijacked, and resolved another fake server...

So... better than the mail... i preffer login to the site (using https, and some certificate) , and see what's going on there.
(and first, i check the correct dns entries, correct response/trace from servers, etc)

I'm very paranoid about my CC info.

I have sent the money in US dollar bank notes in an envelope when I
bought stuff from Ben Smith.

Just use insured mail and you will be fine. Bank notes in letters are
often illegal and insecure but if insured perfectly OK.

Thanks, that explains the blinking LED's.

After the TT has been idle for a couple of days I turned it on again
today and now EtherNEC refuses to work at all... Strangely it now
displays the correct MAC address again under Magic but no blinking LED on
the switch when sending Ping's. The EtherNEC LED does blink, however.

Under Geneva/TOS all LED's on the switch blinks so I guess the packets
that goes out are corrupted. Any idea of a MS Windows or Debian Linux
package that can display incoming raw Ethernet packets?

I'm now on a nullmodem subnet again and it definitely runs slower
compared with Ethernet...

On the other hand I managed to get my Stacy online using STinG and my
Siemens S35i GSM phone over the weekend! Fetching mail at around 1000
Bytes/sec is even slower but better than nothing if you are away from
home...

LloydsTSB have a message after you log onto their site warning you of this
type of email but go on to provide an address to forward it to...

All UK banks have had these spoof messages for quite some while...

You could use either tcpdump or ethereal under Linux. While tcpdump will
work from a console, ethereal requires X.

If it's connected to the parallel port, rather than a USB port, you
could try typing the following in a DOS command prompt window:

copy /b parallel.out lpt1

When you have removed your head from your own arse perhaps you'd take
a look on Ebay.

Try Ebay Germany.... you'll find lots of MegaSTEs over last few
months, probably lots more than Falcons. I've been watching but since
you're clearly a Yank-o-phile you probably only looked on Ebay.com ;-)

How about defining the local printer as an LPR printer. Then using LPR to
print to localhost ?

Why not just port GNOME or KDE? That should yield quite a number of
useful applications. There are a number of office style applications
(abiword/gnumeric) developed for them.

Seperated from X, those interfaces might even be able to run well on
older machines.

>work from a console, ethereal requires X.

Thanks, Ethereal now up and running.

Rebooted to Geneva. STing Ports Setup show correct MAC address. Ping
192.168.0.11 (Linux box). All LED's on switch and all netcards blink.
Ethereal captures nothing!

Ifconfig on the Linux box show no received, dropped or error packets. The
only trace is the dropped packet count on the sending TT.

Back to nullmodem on the TT and Ping 192.168.0.11 again. Ethereal
captures everything and seems to work OK. ARP requests from the switch as
the Pinging TT (192.168.0.194) is on a subnet and can't be found etc...

I don't have a hub or crossed over TP-cable here so packets must go
through the switch. As all LED's did flicker something arrived to the
Linux box. Maybe the Network card discarded the packets directly?
Checksum error?

1) A CT60 compatible graphics card.

2) A SCSI --> USB adapter for the Atari line.
(Note: This is not the same as USB --> SCSI)

3) Printer and scanner drivers.

Unfortunately, I have little hope in #2 and 3. Therefore:

4) Enough work done on Aranym so that the Linux printer, scanner, and USB drivers can be called by the Atari OS.

Atarily yours,

Galen (who is this week celebrating his 13th anniversary of using an Atari as his primary computer).

I like Aranym, It has great use for me coding at work. Would I ever
replace my CT60 falcon with it? Never. It's a good help for me, never a
replacement. Just as well, I can provide a good home for that falcon if
need be ;-)

We're working on that. First step is getting GTK-2.2.4 (or any 2.x series
version) running under MiNT and it's proving quite a challenge. Nobody
mentioned it because we do not as of yet know it's possible. Gtk 1.x was
a great success but 2.x offers much better abstraction to allow something
like making it gem/vdi native. It should be interesting nonetheless

Thanks,
Mark

See what I mean? Your views are obviously laced with one sided propaganda. I simply implied that BBC is a bit on the snooty side. I suppose there is need for that on the planet, and plenty of room for it; however, it is in my opinion snooty. The 'anti-American' banter evidenced here of late is a prime reflective example.

1. 90% of the porn slogged off in the USA is imported from Europe and Japan. The other %10 is mostly produced in or around a city called Las Vegas, which interestingly enough is driven by foriegn investors. It's also worthy of noting that rather large chunks of Hollywood, where the so called 'American Image' is portrayed have been taken over by foriegn investors who out right refuse to produce anything above low class 'rubbash'. It's kind of sad that our Mother and Father nations beat the baby for eating sugar with one hand, while laying out troughs upon troughs of cheap candy for the child to feast upon. Loose morals? I do believe it was the British who taught the world about divorce, secularisum, and the seperation of church and state. It's a melting pot here, and you'll find more differing 'sets of morals' than one can shake a stick at! Your viral warfare is pretty slick....but enough of us are on to you that it's never going to work. Maybe you think the trash-traps being set in the USA will succeed someday...meanwhile, I'm most sorry for your own sons and daughters who are being enslaved to make porn trash and run grand drug-ok districts. Isn't that just like the BBC? To point fingers at the USA while they have your sister in the back room doing a BDSM shoot in exchange for a body peircing, some cool tattoos, and a shot of heroine.

Again, ?maybe? the BBC only shows the racy minority driven side of life around the world, while carefully deleting anything and everything that might show decency exists anywhere else on the planet but Mother England.

2. Unlike BBC, the Queen is very good about listening to all sides to a story, in a fair and balanced fashion. She actually ENCOURAGES differing ideas and opinions to be discussed both in the public and private sectors. I'd dare NOT call the Queen a slapper! The BBC is cool...so long as there's another channel or 5 to balance it all out. Is there? I'd love to find out some day ;)

3. I have no clue what free nylons are. Please explain?

4. I don't chew gum, nor do my associates.

> > Try Ebay Germany.... you'll find lots of MegaSTEs over last few
> > months, probably lots more than Falcons. I've been watching but since
> > you're clearly a Yank-o-phile you probably only looked on Ebay.com ;-)

No, I haven't looked on German Ebay lately.
1. I don't understand German.
2. I'd rather not have to spend $200 changing out the TOS, keyboard, and power supply.
3. Ever shipped 30 lbds of boxes across the Atlantic? I have....sometimes it's worth it, sometimes it's not. If I wanted a Mega STe that bad, for that kind of money, I could get one from Best or ATY in California. Agreed, it may seem a bit expensive to do it that way....but all considered, it'd be about the same price or less. It's not that I have a problem doing buissness over the pond....I do it all the time, but in this particular case it just doesn't make sense for 'me'.

The whole notion that people are biggoted and slight minded because they don't instantly scour EVERY source around the world is just plain strange. So is the name calling and type casting of anyone 'non euro'. My friends across the pond make the EXACT same mistakes every day with posts and searches; however, I chock it up to being human, not nationality or geography.

Happy livin'!
Brian

I haven't tested it much lately but I've been using it on a Windows XP system and it works fairly solid. Windows is a back burner OS for the programmers as their main focus is on Linux. I will try and build a Linux system someday to try it out, but I will only use Aranym full time in combination with Windows, so I hope they change their support thoughts of Windows. :)

I read the developers forum often and they really seem to put a TON of time into this thing.

Well I got my Mega STE from Germany :) try asking the seller via
e-mail if he is willing to ship to the USA..but bear in mind 2
things..shiping + wire transfer fees will most likely cost what the
computer does :P also go into your prefs and set it for all countries
then the ones from Europe ect will show up..and please watch the

Yankee comments :) I ain't from New York.

How exactly do you mean "need TOS 4"? It's in all Falcons, and it's not
the last version anyway, that's TOS 5 which runs on Milans.

Maurits.

Considering that it is not right to judge or talk about somebody without letting him or herself in the discussion i do feel i have to get into this. I fully do not agree with all what has been said about Dennis. If i ever have to point out somebody who is the most loyal to this platform it'll be Dennis. Supportive on many ways. And i do not share the experience ever have had any wrong advice from him.

For more than 13 years now i am using a TT as my main computer and i am sure it would not have gone for such a long period if there was not the support from Dennis.

Please use your energy to do something positive concerning this platform (like Dennis does) and not the other way round.

Nobody can match his dedication to Atari. End of subject.

Raoul Teulings
3 x TT, 1 x Falcon, 2 x 1040 ST, 1 x Stacy, 1 x Stacy4, 1 x STBook, 2 x Portfolio, 1 x Jaguar, 1 x Lynx, 2 x SLM804, 1 x SLM 605.

Porting Open-Office to the Atari would be a huge effort.
In the Atari SpareMiNT project you will find many applications coming from the Open-Source/Linux world, that have been ported to run with the Atari FreeMiNT OS. Most of them are text based tools, but there are also a number of apps using X. On my Atari Falcon/CT2b these graphical apps are horribly slow. On a fast Linux based computer running Aranym things will be more interesting. But in that case the question is: why should I waste so much harddisk space to have Open Office running in my Aranym environment, if I already have Open Office installed on the same harddisk running directly under Linux ?

For the authentic "Atari feel" I'd rather use Papyrus Office or Tempus Word in that situation, and switch to Linux to run Open Office.

But maybe some day in the (not so far) future someone will port Open Office for FreeMiNT. You could have a fast Intel/AMD based computer with a minimal Linux installation completely dedicated to Aranym. Maybe even boot (almost) directly into Aranym. And then have all those wonderfull Open Source apps like Open Office and Gimp running on a virtual super Atari for a very small price. (Someone is actually working on porting the GIMP to FreeMiNT. It's not so easy, but will eventually happen.)

YES IF you fitted the CT60 with solders !
Without solders, the SDMA clock is unchanged = buffered if a buffer was here & unpatched if no buffer was here.

> CT060 termination resistor on SDMA works fine with Afterburner too,
> but gives Mighty Sonic fits. Mighty Sonic and Nemesis require SDMA
> buffer almost always for proper operation.

I don't care about nemesis or sonic, because CT60 offers the same features at 25 MHz with solders.
I spent a long time to solve the SDMA problem with CT60 at 16 20 & 25 MHz bus and now I don't care if CT60 don't work correctly with other booster.
For me, using 2 boosters both on the same mb is a stupid idea if the most powerfull booster has features replacing 100% the second booster !

I agree with this, and I am definitely not Dennis.

Dennis has done a lot of work on translations that have benefitted
everyone who uses these programs. I hope all the bitching at and
about him doesn't discourage Dennis from continuing the very useful
work he has been doing to make Atari a more useful computer.

The Anodyne Software web site has been updated, as follows:

The ExtenDOS Gold MiNT XFS is now available! Although this is still a beta
test version, it is believed to be both useful and stable. The XFS is being
distributed as an update to the current version (v3.4C) of ExtenDOS Gold. It
is available via download from either our web sites at the following URLs:
backup site (preferred): http://www.cyberus.ca/~anodyne/egold/egld_390.zip
main site: http://www.anodynesoftware.com/egold/egld_390.zip

Please note that some users are still experiencing problems with downloading
files from the main site, so we suggest that you obtain your update files from
our alternate site, as shown above.

Thank you for your interest in our products!
Roger Burrows

> system.

Aranym is nice, if you want to compile things with MiNT for example. But
it never can give you the feeling you have when sitting in front of a
real Falcon. Sitting in front of a PC running an emulator (or virtual
machine if you prefer this) isn´t just as nice as sitting in front of an
Atari. That is why Aranym is not THE alternative for me.

Matthias

254. CT60 Problems

Newsgroup: comp.sys.atari.st
Date: 2004-01-14 20:35:23 UTC
From: Mark D <mducksub@nossspamXXatari-source.com>
Message-ID: <pan.2004.01.14.20.35.23.337093@nossspamXXatari-source.com>
Source record: 21742

Hello folks,

I *think* I found the definitive source of the problems of my ct60. I run an fpu test under 030 mode, 10,000 of 10,000 test calculations are successful and accurate. I run this same test under 060 mode and 0 of 10,000 test calculations are accurate. They are returning, I do have an FPU! It's just BROKE! This explains why ONLY gcc is broken!!!! Gcc is one of the only apps I use that uses fpu! We figured this out because I had troubles with a demo that used fpu too!

I cannot even begin to believe that the 060 chip was causing this all this time, but I'm going to get another chip and try. Nobody breathe until then though, I'm so tired of chanting "hey I found the source of hte problem" and it turns out to fix nothing at all.

Thanks,
Mark

You may know that the 68060 need a FPU emulator to run properly with FPU
code. That is because part of 68881 code is not implemented in the 060
instruction set. Anyway, the FPU is inside the 68060 chip. For the 030,
the FPU is external (6888[1-2]).

You can find this emulator if you fetch the one that is designed for
the Hades 060 at the address :

http://www.kingx.com/kingx/medusa/thes-download.html

and you download : Hadessh.zip (279kB): Neu!Hades software and
documentation. Stand 8. April 2001. The emulator is called FPU__3.PRG.

You can also download the emulator that I built, included in the
archive of POV at :

http://eureka.atari.org/pov31g60.lzh

The emulator is called FPU060.PRG.

Both emulators are not guaranteed to work properly.

What you can do is to try FPU__3.PRG.
If it doesn't work then use FPU__3.PRG + FPU060.PRG, with
FPU060.PRG placed after FPU__3.PRG in the AUTO folder (when
there's no sorting of PRGs in the AUTO folder).
FPU060.PRG may not work if it is used alone. But you can
try a few configurations.

Let me know ...

Regards,

To take advantage of any improvements would likely require modifying TOS. The CT60 (as near as I can tell) uses a modestly modified 4.04. My point was that the AFROS project might be a better vehicle for future hardware.

<big cut>

CT60 routines already contain FPU emulation is neede. Why they do not work in Mark case you may ask? His CPU is supposed to have FPU (and it seems it has - but broken) so FPU emulator is not enabled.

It if possible to disable onboard FPU, then FPU emulation may be used.

Well, then. If I told you that FPU060.PRG wasn't working alone, that
is because it is a patch for 060 FPU emulator. If FPU emulation routines
are included in the software designed for CT60, then FPU060.PRG might
patch it, and it could have an effect on FPU emulation. If I've made
that patch, that was because the FPU emulation wasn't correct, and
that I had a lot of problems with Persistence Of Vision (POV) with
the software that was supplied with the Hades 060. It is anyway
originating from Motorola sources. It might do something good ...

> It if possible to disable onboard FPU, then FPU emulation may be used.

There's no problem with trying to patch the FPU emulation, and
FPU060.PRG can be useful for that. So, don't hesitate. Friends
told me that this patch was also working with a TT 030, so there's
no real problem with its use. In the worse case, it will do
nothing ... So, let's try it, and tell me ...

I need a TT or Mega STe case for a project I'm planning. Does anybody have a non-working computer they may be willing to part with cheap? An original Mega case would also be acceptable, but the TT/MegaSTE case design was so much cooler that I'd rather use that one, plus it would give me a lot more space to work in. I don't need any of the internal parts, just what's necessary for the structural integrity of the case.

BTW, anybody have any need for a 32MB or a 64MB PC-100 SODIMM? I yanked them out of an old iMac I recenlty upgraded to 256MB. (Trade for the case, perhaps?)

>

Wha...?! A 1040 without a built-in RF?!? Hmm... perhaps the cheapest
option would be to look for a replacement 1040, one with an RF built
in. Or if you're brave (and good with a soldering iron), you could
obtain a non-working ST and transplant the RF modulator.

Might be possible, but without an Atari monitor to hack a cbale from
it will be a challenging hack. And even then I suspect the sync rates
will be all wrong.

> What are my other options if I want to use the color modes of the ST ? I
> came accross some information regarding a ST to S-Video adapter called

To use an external RF modulator you will need to have AV output, which
the ST does not have.

> connectors ?

Hmm never saw this, but judging from your description these must be
composite signals with sync and lumination for one color. The ST doesn't
provide these (only R, G and B signals with separate sync, and composite
video in the models that also have a modulator built in (STm/STe)).

> What are my other options if I want to use the color modes of the ST ? I
> came accross some information regarding a ST to S-Video adapter called
> "Video Flyer" (I think). Anyone knows where to find one ? Or an external RF
> modulator ?

Electronic stores probably have converters from R/G/B/Sync to
ColorStream. This would give a much better quality than modulating the
signal to RF. It would be even better if your TV also had composite
video input (just one RCA for the total picture information), because I
know there are simple modulators for that (R/G/B/Sync to composite video).

A final possibility would be to find an old VCR with a scart input.
Might even be cheaper (second hand) :)

Maurits.

It's not that rare. The ST and STf have no modulator. Only STm, STfm and STe have (guess what the "m" in STm stands for) :)

Maurits.

I can't help with that specific program, but you might want to look into setting up a TCP/IP network between the two computers and using NFS, which is a standard file-sharing protocol. Here's a page with documentation on doing this:

ftp://gem.win.co.nz/hall/hardware/stpc_nfs.txt

Note that I've not done this myself, so I can't offer advice beyond this pointer. I'm just suggesting it because it's a solution that uses a standard protocol.

278. UK; Who would like an original model Atari 520ST with B/W Monitor?

Newsgroup: comp.sys.atari.st
Date: 2004-01-15 14:47:03 UTC
From: Speeder <almostelvis@hotmail.com>
Message-ID: <bu6956$595$1@sparta.btinternet.com>
Source record: 21667

Hi All,

First, I am in Northwest England. UK.

I have an Atari 520 ST with a black and white Atari monitor. This was the first model released in the UK and it's been in my family since new (1987?) It appeared to be functioning okay last time I checked it a few months ago. I have some original games; Brattacus, Starglider, Psion Chess. I have the disk drive and mouse also, probably have the manual, possibly other ST stuff.

I need to get rid of it, but rather than throw it in the bin I would like to offer it to a good home i.e. one of you people.

I don't want any money, but collection or postage cost would be the responsibility of the person wanting the items.

Send me a mail if you are interested.

Terms & Conditions:
I may retract my offer at any time and keep the items.
The items are given as seen.
I do not assert that the items are in safe working condition. (I would recommend the subsequent owner has them checked by a suitable professional.)
I hold no responsibility for the items once they have left my possession.
Etc etc etc.

Regards,

Speeder.

Recent stable (1.15.12) FreeMiNT kernel may have problems running on ST due
to 4MB memory limitation. In fact I doubt if it will run.

Has so much been added then? 1.14 together with an NFS driver wouldn't
eat more than a few hundred KB.

If all you want is to share a PC drive, you don't need N.AES or MiNTos
:) (or the latest kernel).

Maurits.

ROM GEM will not work with 1.15.12, so yo need other AES and desktop (if you want desktop compatibile enviroment), and it consumes majority memory. You will have very little memory left, and it will be unusable.

Bere kernel+CLI shell would leave more memory, but such setup is not so user friendly ;)

Hi all,

As a new subscriber, I am extremely disapointed to see such a problem on this newsgroup.

Aside from the fact that personal attacks based on someone's supposed nationality are inapropriate, what's the point of an exchange like this:
- Foo: "Hi, I'm looking to buy an [item A]. I need one."
- Bar: "Hi Foo, I have an [item A], but I won't sell it to you."

Hum... Should all the subscribers to this group who have an [Item A] but are not willing to sell it respond to Foo and tell him ? Perhaps everyone who does not even have an [Item A] should also write back and notify Foo they can do nothing from him.

About the personal attack now:

Who cares about any of this group's subscribers nationality, race, religion, sex, etc. As long as we are all Atari fans, are we not all welcome and united in our passion ? Of course, if some weirdo alien starts talking about Amiga, that'll be another story ;)

Michael

Nationality:
Atarian.

Something like this, I suppose:
http://www.preromanbritain.com/gwem/martbean/ataridiy/conv.htm

I was thinking about trying to adapt an RF modulator for Nintendo N64
(they're pretty cheap), but I know the picture quality would be terrible
:(.

Thanks,
Michael

Kees,

This is me, Dennis, the *real* one

>Happy I did't buy Tempusword yet, because I don't believe
>the nice words of Dennis anymore. I bought already too much
>hardware because of the enthousiasm of Dennis.
>May MS bless him.

On 03.11.2003 in Message-ID: <1068060744-369975AEicMi@gmx.net> I posted the
following:

<SNIP>
>>> sombody knows how the TW project is going?
>>> Translations and other good news about it?
>>
>>Translation into English continues. It's a big job as you can appreciate.
>>
>
>The german edition will do. Any opinions?

Why don't you download it from http://www.tempus-word.de , install it and
form an opinion yourself?
The English translation is moving slowly but steadily in the right
direction, Tempus Word NG will definitely be available in English, have
some patience, the translation of such a project doesn't happen overnight...

<SNAP>

Where are the nice words?
I've asked you to USE your brains and decide for yourself if TempusWord is
the kind of app you like and have a use for. You obviously didn't... :-/
Is this kintergarten? Do I have to hold your hand in every decision you're
gonna take?

As for you buying to much hardware... one could say that it's never enough
of course, I told you what **IMO** was the best and cheapest way to get a
really fast Atari on your desktop. You've got the hardware now and it seems
to me that you're disapointed with the results... instead of bitching about
it may I suggest to start reading some manuals and set up the whole lot
correctly, it worked for me and others, there's no reason why it shouldn't
work for you, just put some effort in it.

Cheers from Belgium
Dennis

Hi Michael,
We're just havin' a little fun. Really, most of us do get along quite well, even when we agree to disagree. Some folks on the newgroup disagree just to disagree and get a thread of chatter going every now and then. After a while ya learn it's a little like your local pub or coffee shop. Sure, the premise of the establishment is to 'drink and eat', but is their any harm in a little BS on the side?

Honestly, I don't think any of us are so small minded as to carry every sensability around all the time like some chip on our shoulder. We all put our pants on one leg at the time like everyone else.

I honestly was a little annoyed at the implication that Americans, and only Americans zone from time to time and forget to acknowledge the fact that the world is bigger than what's in our back yard. Am I really 'that' sensitive about it? No...

In reading the rest of your post below, I think you get the idea.
Atari Fans....
Just burnin' a little free time and tryin' to have fun...not really at anyone's expense.
Sorry if feelings 'truly' get hurt.

BTW....anyone out there that can tell me how to detect which revision of mother board is in my Amiga 2000? (just kidding)

Happy livin'!
Brian

RF
> modulator ?

Hi Michael, I reakon the easiest way out would be to get a Amiga A520
external modulator and make a 13 to 23 pin adaptor. This has a modulator
that produces both rf and composite. The just tap the audio using the 13 to
23 pin adaptor. easy:-). Oh the STF is lacking alot of extra circuitry as
well as the modulator so just dropping in a modulator is not an easy job.

Sam,

On a non-accelerated falcon, MiNT works and works fairly well but in my opinion was too slow to deal with. The features are worth the general slowdown though so on an accelerated system with lots of ram, it's definitely the system of choice for me and many others.

As far as installing though. First thing is first, install easymint and CAREFULLY read the documentation. There's a lot of stuff you have to do including having a partition ready to be demolished. Then after easymint is installed and running (or not), come here with more specific questions, and we're all quite happy to help you become another mint user.

Thanks,
Mark

> I'm contemplating installing it on my Falcon since Magic is dead.

SamF,
It's not dead as long as it does the jobs you need done.

What do you want a possible MiNT setup to do?

If you're simply courious, and enjoy this sort of thing, I say clear a partition
and go for it :)

Things I feel you'll want to look into.

1. HDDriver is recommended if you want to take advantage of the latest
partition schemes and file systems.

2. NVDI, or a combination of fVDI and Speedo GDOS will certianly be of
interest.

3. Plenty of RAM.

In my opinion, what really sets MiNT apart from MagiC are networking abilities
and unix portability. Beyond that, at 'this' point, I personally don't see any
major advantage to abandoning MagiC.

I use stock TOS, MagiC, Geneva, and MiNT all four, as each one seems to offer
various advantages and disadvantages for various work environments. I also have
used N.AES for quite some time.

So...what kind of workstation are you shooting for, that MagiC doesn't do....
That's a good place to start advising more specificly.

MagiC may in a sense be dead....
But one fact remains....
It's pretty fast and efficent, and alot of good software which is also 'dead'
works happily with it.

Hey Franï¿½ois, you don't know the CT60 !

The 060 FPU routs are inside the FLASH ! So they cannot be patched and they
do not need.
And I'm sure the routs are good because all FPU software run fine on CT60
without your FPU patch...
POV is running on CT60.

And the software mark tried is running fine on an other CT60.
So the 060 is the problem because there is no problem on an other CT60.
Ok?

This sounds very interesting. I have an A520 hooked up my a500, and wouldn't mind giving it a go on my Stacy. How difficult is it to build a 13 to 23 pin adapter? Any pinouts for such a beast on the net?

Should not be too hard.

http://www.howell1964.freeserve.co.uk/Atari/ST/Atari_ST_Video.htm for the
stf side.

http://www.ntrautanen.fi/computers/hardware/misc/amiga_rgb.htm for the Amiga
a520 side.

this is only a theory mind you, if the modulator uses csync you could tie
the v and h sync together via a low value resistor. A little experimentation
would be required. Usual disclaimer apllies of course;-)

Totally agree with you.

Personally, when i feel attacked, i just stop answering. There is no
point in follow the thread, making it a flame war.
Besides, all internet is full of trolls, spammers, flamers, kiddiez, etc.

In here, we are gather as an Atari Nationality. Much of us, arent from
usa. Some of us, doesn't have english as our primary language, that's why
time to time (or all the time) write things a bit confusing.
But with the GREAT help that i've found on almost every people i read
here, i've been able to improve me. and revive the old atari tradition, dead
on my country.

I think, the only thing we must do.. is keep this group alive. Cause all
atari was (and is) the best computer ever built. (Yeah... it is awesome how
they survive to electric shocks, dust, metal, and even water.... really)

Regards :o)

I agree here. With MiNT 14mb is esential and even with 14mb, MiNT us usable in "multitos" mode, which means kernel+AES (gem) only, no unix part etc. So close to Magic. MiNT even in multitos mode offers some advantages, such as usage of ext2 etc filesystems, u can also use MiNTnet preety efeciently (if u have whole mint setup but not boot in "unix mode" u can enter shell, call rc.net script and the use mintnet) etc, but u need to judge by itself, if that is worthy extra RAM, since Magic uses less RAM and it will run basicaly same GEM apps as MiNT does. (except those with AES toolbars, whuch may make some probs) + some Magic only apps

Since we have nice boot managers, i would install both and use them on demand... And for unix+gem at same time, 14mb is very tight, and its wise to have more RAM... Personaly i prefer MiNT, because its more flexible etc, but on other handm i have more RAM...

U have to use ATX psu in any case. U can use original Falcob case with
ct60, but u need to mount fan sideways, since of on heatsink, its to high.

SF0218,
Hi, I have a CT60 on my Falcon. I have put the ATX
PSU outside the Falcon and ran the wires from the ATX
PSU through the Power Supply Plug of the old Falcon
power supply. Also, remember you must REMOVE the
Falcon Power Supply from the Falcon all together to
make room for the CT60. I have heard of these MICRO
ATX PSU but it seems to me that that would be a very
TIGHT fit and increase the HEAT factor inside the
Falcon. Not to mention you must be extremely careful
how the MICRO ATX PSU is placed inside the Falcon!!!
I would be afraid even if you protected the
motherboard that it may short something some time into
the future. Just be cautious with this method
anyways!!!!!

Thanks,
Carey Christenson

It will run on 4MB... barely. With NVDI, an AES and TeraDesk, one would
have less than 1MB left... drastically worse than with 1.15.0,
sa I returned to 1.15.0 for the cases when I need Mint.

Maybe it might be a good idea to make sure that the binaries of an
older version like that remain available somewhere for the sake
of ST users.

First sold in 1993, somewhat earlier than the previous owner had suggested! Absolutely mint, not a mark anywhere on the casing, no fading or discolouring, box in reasonable condition, manuals, mouse, leads and disks all as new.

4Mb, no HD.

Now. What to do with it. How hard is it going to be, now, to find full RAM and an HD for it; do I need a fitting kit to get an HD? Can I download MultiTOS or similar, since I have an external disc enclosure which has a CD-ROM and HD inside.

It's very nice having such an unusually clean example of Atari's (almost) finest - and for once, at the same time as an ST!

Just to make life good, I also got an RME Multiface for my G5 today - so high-quality digital recording, here I come. Just as soon as I've figured out how to configure Logic :/

>.

If it freezes during booting and NVDI is causing the freeze you'll
probably see the boot process stop as it attempts to load NVDI stuff
(NVDI will be the last on the screen). If so, try holding both shift keys
down near the beginning of the boot process until you see "NVDI not
installed....hit any key" (or something like that). NVDI path to GEMSYS is
important. Assign.sys too!
Loading from the floppy: use a blank disk and hold the ALT key down as
soon as you see the monitor light up (or hear a click from the speaker).
Not sure how long to hold it.
If you get a clean boot then use HDDriver from the floppy to access the
hard drive and either start eliminating stuff in the Auto folder and CPX
modules (including XCONTROL.ACC) or start from scratch by adding stuff one
at a time until you hit the culprit.
Good luck!

The egg. It went this way, first there was a salmon who laid an egg in the headwaters of the Monongahela where at the moment of lay an eagle pounced upon the salmon and brought it back to it's nest where the egg was lost among the eaglets and later when it hatched it acquired feathers for it thought it was an eagle but of course it wasn't. As it grew it followed the eaglets over hill and dale which got lost and came to a highway where there were several rabbits about to run across the highway. The eagelsal (salmon with feathers) was to scared to run across the highway and all the rabbits called him chicken. Thus there was the first chicken and of course it was an egg. Yep, the egg came first.

This is written somewhere in the bible.... Ah... someone's bible somewhere.. Or was it on the Rosetta Stone? Writings in the Great Pyramid? Rantings of an old person up at the "home"? It's one of those mysteries we just have to assume is fact.

I don't want to put my name here.

Open it up and see if it comes with a IDE cable. If it does just connect a laptop HD preferably under 10Gb. Grab a newer HDdriver software program and off you go.

The Falcon does not run a lot of ST games, but runs most everything else.

I'm a recent new owner of a CT60. It booted up right out of the box,
and even though I have an EC, not the full version 68060, my Falcon
screams in comparison to what it was before! I have not boosted the
motherboard, just installed the CT60 with no solders. It is
certainly no "hack" but a very sophisticated addition to my Falcon!
Thanks Rodolphe, and keep up the great work!

Well i remarked to few US based guys seeking for stuff with good wishes, and on end they did try to buy from EU, on which they didnt even think off earlier. I really doubt that has anthing with nationality. If it has it is actualy shortsightening or no will to even check outside US for many US buyers. Im in process off geting a Falcon for 50E (45USD aprox) for a US guy. And with postage from UK to me and then from me to US it is WAY WAY bellow prices can reach in US. The only prob can maybe be kbd layout, but i doubt thats a real prob (i use german, uk and swiss-german ones regulary).

Janez

P.S it also can help for ppl from this group to show up on IRC in #atariscne (not in #atari) talk to guys there... Many of us are willing to bid or buy stuff from EU ebays and then sent it further... or just plain atari talk and "live" help, etc. There is a world outside this group as well :)

Hi Sam,

>Is Magic still being supported/developed anymore or has it gone by the
>wayside as well.

Yep, it's supported by the distributors and by 95% of the programmers. As for the development - the author is busy working on the OS X version, once that is finished, no doubt we'll see some spin-offs appear from it on this platform also.
MagiC 6.2 revison C is available from the English distributor Atari Workshop, if you happen to have an older version then get in touch with ASH for a relatively cheap German update, on the DDP website (see signature) you'll find a patch to translate the German version into a 100% English one.

Cheers from Belgium

>In other words, Magic is a dead duck. Oh well. Mint was always good:-),

It's dead allright, just as dead as your TT and Falcon. Everything related
to Atari is dead... it died some 9 years ago. We all pretend that the flame
is still burning, but let's face it, it doesn't even flicker anymore ;-)

>better get the latest version of Xaaes and Terra Desk.

Yes, especially Terra Desk, that's really an improvement... if this is an
example of moving forward I rather stay behind and play with "dead" stuff.
But then I shouldn't knock it, should I? It's free and "open", and that's
the holy word in here lately...

Cheers from Belgium
Dennis

Hi Brian,

>In my opinion, what really sets MiNT apart from MagiC are networking
>abilities and unix portability. Beyond that, at 'this' point, I personally
>don't see any major advantage to abandoning MagiC.

True, but these don't come standard, without MiNTNet for example MiNT has
just the same networking abilities as TOS or MagiC. And since there's a
third party "dirty hack" of MinTNET available called MagiCNet, the
networking abilities are no issue anymore.
Which only leaves unix portability....

>I use stock TOS, MagiC, Geneva, and MiNT all four, as each one seems to
>offer various advantages and disadvantages for various work environments.
>I also have used N.AES for quite some time.

You shouldn't really write this... some people here don't wanna hear and
know this. I've been flamed for less, but then who cares anyway? ;-)

Cheers from Belgium

>>In my opinion, what really sets MiNT apart from MagiC are networking
>>abilities and unix portability. Beyond that, at 'this' point, I personally
>>don't see any major advantage to abandoning MagiC.

Main MiNT advantage are imho unix portability (as u said), where i dont mean monsters as OpenOffice etc, but various devices, network, filesystem drivers, or some apps and tools we realy lack on Atari, based on fact that ANY GEM app can use those. (in other way we could just boot linux)

Other very big advantage is flexibility: use Xaaes, if u dont like use N.AES. there is also new VDI in making and as it seems it will be very good. And of course portability of MiNT itself. U have 030, compile 030 version, or 040, or 060. If we ever (i hope so) get ColdFire machine or PPC or whatewer, MiNT is ported easy... Forgot to mention, since Xaaes is in making, authors DO accept proposals. This dont mean all will be accepted, but u can affect the AES itself.

Main disadvantage, esp for ST users is RAM usage and speed, esp on low specs machines. Magic is more compact, and more close to hardware and on 4mb or less systems perform great. As do Geneva, but Magics AES is a lot better. Sadly, reason for Magic compactness make it realy hard to port on some less compatible machines.... So on machines with less as 14mb, MiNT will not feel nearly as good as Magic. Except if u use it as server machine, i used a 4+4 TT as server and gateway, since i had reibl card on TT and cable modem, and my main machine (falcon) PLIPed to it. Or something like that. OR if u realy realy want unix, but even CLI only on 4mb is not comfortable at all.

> True, but these don't come standard, without MiNTNet for example MiNT has
> just the same networking abilities as TOS or MagiC. And since there's a
> third party "dirty hack" of MinTNET available called MagiCNet, the
> networking abilities are no issue anymore.

Well it still remains. But mainly for using apps or drivers which need Unix filesystem tree etc.. I agree those are somehow extra, and u will need those mainly if want to live with unix domain, so wont run Magic/Tos anyway.

> Which only leaves unix portability....

Yes. Altough i would wish u wont refer to that part as unix portability only. Its not just that. MiNT allows (and thats why i like it over linux and so) that even plain GEM apps benefit from Unix domain. Also, porting of apps like OpenOffice is imho still not too real, since those apps are quite big and to expect them to run on 030 or even 060 is a bit naive imho...

>>I use stock TOS, MagiC, Geneva, and MiNT all four, as each one seems to
>>offer various advantages and disadvantages for various work environments.
>>I also have used N.AES for quite some time.
>
> You shouldn't really write this... some people here don't wanna hear and
> know this. I've been flamed for less, but then who cares anyway? ;-)

Lets be honest :). It perfectly okay to write this. Newbies and less experienced ppl will see that its perfectly easy to live with Magic, or MiNT or TOS or Geneva! They will also learn what advantages certain OS have, and what they could use for their specific tasks. And they will learn that in any way thel will use same apps as other users, regardless of OS they use. U know damn well, why u received blaiming and why other ppl didnt, even if they wrote what Brian did (altough no "shit, crap, lamers...." words in his message). Please dont understand this as patronising, but tone of this message is for me just fine and can hopefuly make this thread constructive.

I just wish users can learn as much they can bout those OSes. With pro and contras, and im not affraid to write some pro's bout my choosen OS as well. So in short: if u have 4mb, go for Magic/Geneva, If u have 14mb machine, u can also got for MiNT, but mainly in so called multitos mode, which is mint kernel+aes (naes or xaaes which is free). Above 14mb MiNT will really felt good, u wont have lack of RAM troubles and so on. But if u only live in GEM domain, no need for Unix etc, can stay on Magic, u will spare RAM and quite a chunk of HDD space (full MiNT require quite some space). My fav setup is multi-OS, since xboot or similar allows easy rebooting anyway!

Janez

Message-ID: <o8eOb.18674$R85.9248@bignews3.bellsouth.net>
Source record: 21622

I like to use Geneva on my Mega 4 because it seems to work well with MROS (Steinberg) applications.
I put a Marpet Xtra RAM + board in this machine, and I can't get Geneva to behave with any stability using this board. It seems to work fine under stock TOS 2.06 and with Magic 6.01.

Things I've tried...
Various auto folder orders.
Adjusting the RAM flags in all of Geneva's TSR and utilties.

If I put Geneva later in the auto folder, I usually get several bombs when Geneva tries to load.
If I put Geneva near the top, I usually get 'recursive calls to GDOS' errors.
Once or twice, it actually loaded, but Geneva doesn't see the extra RAM....some files with TT RAM flags set did load in the upper memory, but the machine wasn't stable but for a minute or two.

The Xtra RAM software I have is version 1.1 I believe.

So far, no luck with Geneva, and I wonder if anyone knows an answer.

Thanks,
Brian

?????

If you have a problem with CT60 you can contact me !

This time, I have only 18 cards to ship among 150.
All the 150 - 18 = 132 users are happy it seems...
I have no bad echo except from 1 or 2 with bad 060 CPU, one that had a bad
SDR updated (I shipped back yesterday !) and one that destroyed the ABE &
SDR chips with a too high voltage from a defect ATX PSU (!),....
No other problems known ....SORRY !

What's the sense of your message ??

Clockmeister,
I have had very little problems with my CT60!!! I
was one of the FIRST to get my CT60 back in JUNE. I
had to do all the trace cutting and ABE and SDR
updates and soldering. I have done it and many others
have done it as well. I see NO problem what so ever
with the CT60. I have had my Falcon on for nearly 40
hours straight without PROBLEMS. Out of the 512 megs
of memory I had used up approximately 300 megs with
surfing on the internet with CAB and HIGHWIRE and was
doing some research not to mention 10 applications
opened all at once. I think you may want to get ahold
of Rodolphe before spreading FALSE rumors.

Thanks,
Carey Christenson

I have 13 of them. Im also proud on them, use 3 on daily basis yet i dont list all of them or even till to the last one of peripheral devices i have plugged in, down to "Subwoofer Satelite speaker system" or the brand of my table and so on. I just find it funny, since most of posts dont even reach the lenght of signature. And ppl here propagate freedom of speech....

No need to mess either Europe or MiNT into this. I dont see what that have to do with the subject. Or u have a problem with those 2 subjects? Or u dont like me since im in Europe and use MiNT?

Hi Rodolphe,

Rodolphe Czuba wrote:
> Hey Franï¿½ois, you don't know the CT60 !

Yes, of course ... I have a Hades 060 since june 1996 ...

> The 060 FPU routs are inside the FLASH ! So they cannot be patched and they
> do not need.

You know, as far as I remember the FPU code generate an interrupt
which address is located in the vectors table, in the first bytes ($96
as I remember) of the RAM. This LINEF vector can be overwritten (that's
what is done with my patch) so that the emulation code can be modified.

So, I am not changing the code which is located in the FLASH memory,
I just completely replace it with the code that is originating from
Motorola sources. This code is fully reliable. Is that all right ?

This is rather technical ...

> And I'm sure the routs are good because all FPU software run fine on CT60
> without your FPU patch...
> POV is running on CT60.

I'm sure it is ... Well before I made the patch for my Hades 060, POV
was supposed to work. But how far did it worked ? I encountered some
minor bugs, that revealed that the FPU emulator wasn't reliable. You
know that I'm peculiarly interested in the usage of FPU code, because
I'm writing Eurï¿½ka. At the date I am speaking of, Medusa people were
telling that they had done a better and quicker emulation that Motorola
would have done. They were wrong. The Medusa emulator was bugged. I
proved it with my patch. I was the first developer that made POV
to "work" on a Hades 060, and I built both POV + FPU060.PRG to
demonstrate this fact.

So I'm not telling that you are wrong, nor that your emulator is
bugged. But trusting my experience, if someone complains about FPU
on a 68060 machine, without knowing the precise problem, I tell
him : let's try the patch I've made ! It may do something good ...

> And the software mark tried is running fine on an other CT60.

How far is it running "fine" ? What is the nature of the bug. What
reliable tests have been made ?

> So the 060 is the problem because there is no problem on an other CT60.
> Ok?

Well, you're much more aware on the hardware part than I am ... But,
I wouldn't be so categorical ...

343. TT030 memory board from Niels Trettin

Newsgroup: comp.sys.atari.st
Date: 2004-01-17 21:47:29 UTC
From: Bill <bill@nomail.invalid>
Message-ID: <170120041647293244%bill@nomail.invalid>
Source record: 21632

I contacted a Niels Trettin in Germany about getting a TT ram board. I originally saw this board advertised on eBay in November '03, and thought I saved a link to the eBay description, but I can't find it now. The board held quite a large amount of memory, but I don't remember the exact amount. Maybe 256mb?

Niels Trettin wanted about 75 euro for it but I haven't ordered one yet. He suggested I just mail the cash money for it, but I was leery of doing that but 75 euro seems like a heck of a deal if the board is good.

Has anyone here ever done business with Niels Trettin or know any details about this particular memory board? I couldn't find any reference to it on his web site.

344. TeraDesk 3.01 is available

Newsgroup: comp.sys.atari.st
Date: 2004-01-17 23:24:50 UTC
From: vdjole@EUnet.yu
Message-ID: <bucg7vkpv1@news.eunet.yu>
Source record: 21635

Hi, all;

Version 3.01 of TeraDesk open-source desktop is available at:

http://solair.eunet.yu/~vdjole/teradesk.htm

This is a bug-fix and code-optimisation release; no new features this time.
Improvements relative to TeraDesk V3.00 are:

- Restored full functionality of the name-conflict dialogue.
- Repaired a bug in cookie finding routine (inherited from V2.*) which
could sometimes make TeraDesk practically unusable if the cookie jar
did not exist.
- Better handled a consequence of a TOS 2.06 bug related to mouse clicks
(manifested on desktop icons if no windows were open).
- Fixed a bug which disabled seting of configuration file name in the
startup .BAT file (btw. should startup file feature be considered
obsolete- does not seem to be of much use anymore?)
- Fixed bad directory window redraw in icon mode with XaAES.
- Fixed bad redraw in font-selector listbox with XaAES.
(these two were more faults of XaAES (V0.963), not TeraDesk)
- Set exit with "OK" from "Video options..." to always redraw the complete
desktop, as a help to recover after accidental screen corruption.
- Some code size optimizations.
- Some improvements and additions in TERADESK.HYP.

Beside the desktop itself, the V2.* to V3.* configuration-file-conversion
utility is affected by this update as well (because of the cookie bug).

This is definitely the last release in which the file-conversion utility
is supported in the source code. There may be another release relatively
soon with some minor additions and a massive cleanup of soure code (removal
of binary-config-file compatibility and old directory-handling code).

Have fun.

My CT60 is working beautifully!
I've followed every post on every board I know of with regard to the
CT60, and to my knowledge there are few people who have not resolved
their problems!
I'd think you'd be aware that there are far fewer posts about sucesses
than problems.
Posing a question is fine, but refering to the CT60 as "a hack" sounds
biased to me.

First thing's first.. Are you 100% sure this is a fastram board? There's
very very few of these and I don't think the Xtra RAM + was one of htem
but I could be wrong. If you're adding 4 megs of ST-ram to a 4 meg system
which has a maximum addressable of 4 megs without some interesting work,
then that could be the problem.

Thanks,
Mark

FYI, The problems that 90% of people post about are problems with
products that Rodolphe has no control over. Fact is in nearly 100% of
cases the CT60 is never to blame. And I wouldn't stoop to say so. My
problem seems to be my 060's fpu being completely broken.

The PROBLEM is that the 060 is bringing out flaws in Atari's design of the
falcon. How? Well for me, it's because I'm trying to do MORE with my
falcon which brings out the problems I never would have seen before
because I never TRIED to do something like compile a 100 meg source with
gcc!

The CT60 is a god send. Don't question it, it's true.

Thanks,
Mark

> Is it possible for interested people to test the gtk1 ? or even the
> current gtk2 work ?

Patrice,

It's varying so quickly by the day that we just don't have good builds of the stuff yet.

For instance. Yesterday we build GTK2, latest version but no font support, bceause the pango we compiled didn't have modules enabled. Well pango needs freetype backend with newer version of freetype than available so I had to redo freetype rpms because a lot of hacks were in there to get things working before that are now fixed in freetype and ttmkfdir, on top of that, there's font-config and other font issues.

So you see, that even if we get it working, it's not working YET. And when it is working enough to be comfortable, we'll test quite a few gtk2 apps before bothering to release to anyone.

But yes, we will release "alpha" rpm's and compiled sources but for now it's pointless as it just doesn't work yet ;-) ... Did you want the backend stuff that we have that we are confident about though?

atk-1.4.1, freetype-2.1.5, glib-2.2.4, etc

ttmkfdir-3.0.9 I am building tonight - but should be good.

I'm also rebuilding gaim 0.59.9 because I found several errors in my build including not fixing hte stack!

Patrice, email me directly.. we'd be happy to have you involved and have your input! Keith and I have been working for about 10 hours a day for the last week or so on this stuff. The address is just first part @atari-source.com.

Thanks,
Mark

> that there are a lot of posts with reference to getting the CT60 to work
> properly, that is all.
>
> I'm glad it works so well for you!

In a general way, you'll always find more message from people having trouble with something than the contrary.
If something work, you will eventually say it, but most often will not.
If something does not work, you will looks for a solution and thus post messages.
And if the posted solution does not work, you will probably repost to signal the new problem.

So yes, in the end there are a lot more negative comments thant positive ones. Seems normal no ?

351. Dutch Atari day !!!

Newsgroup: comp.sys.atari.st
Date: 2004-01-18 00:43:05 UTC
From: "Ernest R. Schreurs" <ernest@wxs.nl>
Message-ID: <6klj00dvfde54mivi6mulale9qg01eldhd@4ax.com>
Source record: 21639

On sunday the 8th of february 2004, the second edition of the Dutch
Atari day will be organized again in Dordrecht, The Netherlands.
The location is the Titus Brandsma-Stedelijk Dalton Lyceum.
Kapteynweg 3
3318 EC Dordrecht
The Netherlands
Participants can start building their exhibit from 10:00 am. The
event will be open to visitors from 11:00 am until 16:30. Admission
is free as far as I know. It will be organized by Jos Vlietstra, just
like last year. I can tell you that last time, we all had a good
time, so we hope that this year a lot more visitors will join the fun.
Just like last year, there will be a pile-of-giving-away-Atari-stuff !
It would be nice if everyone would bring Atari software and hardware
(working or not) that they no longer need. It will be put on a pile
where everyone can take something of their interest at the end of the
event. It might just be something your fellow Atarian has been
looking for. The event will be held in a gymnasium this year, so we
have plenty of space. Exhibitors should make sure their equipment is
properly insulated electrically. If you wish to participate contact
Jos Vlietstra by E-mail. You can see his E-mail address on this page:
http://www.geocities.com/titusbrandsmacollege/jos
Everyone should bring their own sandwiches and drinks, since there is
no place to buy these close by.

Directions:
By train: go to the station Dordrecht Zuid.
Walk on the left side of the S. van Gijnweg towards the Sterrenburg
district. After 5 minutes, you can see the back of the school. Turn
left walking on the pink Steve Biko bicycle path and follow the green
fence until you reach a gate after about five minutes.
By car: from Rotterdam take the left tube of the Drechttunnel.
Then take exit Papendrecht immediately after the tunnel. At the
traffic lights go straight for a short while, then take a right turn
onto the Laan der Verenigde Naties. At the next traffic lights go
straight on, passing the Shell pump, then take a right turn at the
next traffic light. Follow the road straight on, passing the traffic
lights, take the railroad tunnel then make sure to be in the left
lane.
Take a left onto the kapteynweg and take a left again and park.
Take the pink bicycle path again and find the gate as above.
If coming from the south, follow direction Dordrecht, take the exit
Centrum, take a right onto the Laan der Verenigde Naties and follow
the directions above.

Attention: The front of the school will be closed! Do not be alarmed,
the entrance to this event is on the back.
See you all there!

Mark,
From the software end of things it is my understanding this Marpet board disguises 8meg to the OS as TT RAM. To get software to use the board's memory one is to set the TT RAM flags in a program's file header....just like one would with a TT. In other words....programs that behave on a TT using TT RAM should work with this board.

The board sits in the mega expansion bus and holds 8 one meg simm modules. The board has what ever MMU it needs built in. Next, you put a little prg in the auto folder that tells TOS about the extra memory. It has to be TOS 2.06 btw, as earlier TOS versions can't use it.

When booting, the xtraram.prg tells TOS of the presence of extra RAM, then does a little check on hard drive software for compatability with the new RAM.

Sorry, I do not know Mr Trettin.
I don't recommend sending CASH by post.

Western Union has gotten pretty reasonable for wiring money. He can pick it up personally at any station he chooses, in local cash currency...plus you have some degree of traceability based on his pick up point.

I've used this method for a number of USA-Euro transactions with good results so far.
It's not FREE of course...but it's an option.

Oops, I forgot to clarify something....
The instructions say TOS 2.06 must be present; however, MagiC 6.01 identifies
itself as TOS 2.00. The board works very well here with MagiC so far. I even
have NVDI 5.03 loading in the Extra RAM for a MagiC setup.

Is this possibly something that can be cured with a TSR or external library?
Something like W|Ndialogue does for non/MagiC environments?

Maybe it's a better idea for developers who want a portable toolbar standard to
just invent a new one that can be installed on any TOS variant. Do the empty
routines once...and share them with the community as the 'new toolbar standard'
that works with all popular TOS variants.

I dunno....it's just an idea.

I did. Bought three of them, by simply putting paper USD in an envelope, and mailing it. He suggested registered mail, I did not do that.

They arrived in good order, and fairly quickly.

I have only tried one, and it almost worked. I have some things left to try, but I am working on other things first.

I found, and posted as to where and how, symmetrical 128 Mb 72 pin SIMMS. That is the largest memory it will take. Takes two sticks per board.

For some reason that puzzles me, only 65 Mb was recognized. Maybe a timing error, and there is a jumper on the board for fixing that. Have not done that yet.

He ships the board with a data sheet. The manufacturer was a German company, and the data sheet is in German. It did not give me any problems, and Neils was quite helpful in getting me to information on the SIMM I got.

On the other hand, something involving this Maxon board has frustrated some people. If you get non-symmetrical SIMM, it will not work. If you install jumpers not in accordance with the data sheet, it will not work. I have no idea what their problem is, a defective memory board, or a defective mother board, but my only problem was a trivial one I have not even tried to fix. 65 Mb is more memory that I will ever need.

Thats me frustrated as heck. Cannot get the damn thing to work at all. Ok
dumb question: What is a Symmetrical SIMM? Maybe thats my problem. I have
16/32MB EDO and FPM SIMMs that I tried to no avail. Both installed in pairs
of course.

But back to topic, I also bought one and it arrived no problems, but I
cannot get it to work. Could be a SIMM problem though...

I have no problem buying from people from outside the USA (ooops...gave
away where I'm from :) I have a problem with the postage on hardware!!!
Many times I've sent cash by snail-mail across the pond for new programs or
upgrades.
What I was referring to above was about an un-educated remark in this
thread. By "un-educated" I mean: not knowing that this is a world-wide
Atari community and is realized by those who hang around this ng for a
while. So, politics and info from news media should be put aside. We here
in the USA SURELY are aware that there is more to this world than our
mainland and half of it hates our guts but this is not the place for that
discussion! I don't care where you are from, if you need assistance and I
know something about what you're looking for then I'll put my 2 cents in!

I always wanted to design a CPU upgrade for my Amiga but never got past designing and building my own IDE, RAM and 68010 upgrades due to time restrictions. With such I complex device as an '060 processor upgrade I really do appreciate the amount of debugging and complex issues the designer must be faced with and I raise my hat to him for successfully attempting a project of this nature for such a limited market.

I didn't mean for the term 'hack' to sound derogatory ;-)

Francois,

Your fpu software in any of the configurations that you gave me did not
solve my apparent fpu problems.

What is really strange is this....
Older version of lame that was sent by evl or swe in irc resulted in bad
mp3, encode time 2 hours for 40 meg wav, 128kbit CBR - using fpu?
Latest version of lame compiled 68000 (fpu?), good mp3 encode, time 37
hours 40 meg wav, 192kbit VBR
Latest version of lame compiled -m68060 with fpu, good mp3 encode, time 24
minutes, 40 meg wav, 128kbit CBR.

Software compiled with -m68020-60 works fine for me including
openssl/openssh. Never experienced a crash on any of that stuff. Only
thing that has crashed for me ever is gaim, and gcc. Sometimes I get a
system freeze after having about 50 bus errors with the prior 2 programs ;-)

As you can see: 1) my fpu cannot be so broken... can it!? 2) compiling
with -m68060 works REALLY well even on gcc 2.95.3, and 3) perhaps this
fputest isn't good for 68060.

Can anyone PLEASE make sure this fpu test is good.

The archive is at:
ftp://ftp.lip6.fr/pub/atari/Utilities/fputest.zip

When extracted the test in question is the ACCURACY test, fputest.tos.
Please run this test and report your results - everyone.

This test runs indefinitely. If your CT60 is passing the test you will
see output similar to:
Passed 100
Passed 200
Passed 300
..... up until you hit control-C to quit.

If your CT60 is failing you will see all tests (in my case) or nearly all
tests report as fail. They will scroll very fast on your screen showing
returned value and acceptable value. In my case the values are VERY far
off. Again, hit control-C to quit. If you run for about 60 seconds or so
with no errors, you can assume your fpu calcs are correct according to
this test.

Strangely when
run on one ct60 this test passed perfectly - deez the author of the ct60
specific intro that was working improperly for me. When run on another
ct60 (american, ntsc english setup), the test failed in the exact same
manner as it has on mine. Deez's intro specifically for ct60 is also
really broken on his falcon too. However he can't have a broken fpu as
gcc works perfectly for him. He compiles HUGE packages. His falcon
otherwise works perfectly. Something is NOT right here!

His name is Keith Scroggins, he has a 68060 60MHz full supplied by
Rodolphe. Surely 2 processors both don't have bad FPU?

My processor is a 68060 60Mhz full supplied by vernal elm. My compile
issues go away with caches off, so I yet need to attempt reducing my clock
speed (still need to buy oscillator). PS: Anyone have a 60Mhz oscillator
they don't want?

Thanks,
Mark

Free, open and in spare time. While MagiC rests in peace sparemint, xaaes and teradesk churns out release after release. Slow progress sure, but progress nonetheless. In time their progress WILL overtake MagiC in features and reliability. It's the nature of things. When one developer gives up, another will step in. When one guy gets old and dies, some kid will find interest and buy one of these so called Atari computers. So long as there is any future for Atari computing, be it upgrades, new platforms, etc. Free and open is the ONLY way we CAN go. Therefore it IS the future. If free and open fails, it is probably the time to decide that our platform is truly dead. Time to put our computers in the closet and wait for 20-30 years until they are worth serious money.

Not to mention sparemint has several new package maintainers and a lot of work going on behind the scenes. Work you aren't interested but work that will be beneficial to many nonetheless. Surely we all will end up working up to being MiNT kernel hackers. A team of 10-20 people working on this stuff versus... what? Who? where? .. there's nobody else - just application developers who don't support MagiC specifically, they support GEM which MagiC inherently supports. I loved your 95% figure that you pulled from your posterior earlier. If I had to call it I'd say it's more like 5% of developers develop specifically for MagiC, if even, and more like 95% of developers remaining develop for our charming GEM environment, and really care if things run on MagiC AND MiNT alike.

Yes MagiC is a great system. Great for Atari's that are and will always be stuck near 4 megs of memory. Unfortunately many people these days demand the power and flexibility of a unix based architecture. If only you saw just how well it all integrated into GEM. It's really quite scary. In my world, Atari users want to compete with the flexibility and power that current pc offerings have. They don't only want nostalgia, they want functionality on an alternative computing platform and are willing to pay for it. 150 people who bought the CT60 can't be completely insane. You don't increase the power of your system 10-fold because you want the same features. Projects like the ethernec don't mystically appear out of nowhere. The bulk of the remaining Atari advocacy crowd cares equally for nostalgia and current to future prospects. Nostalgia is easy, get an st and horde a bunch of software and games for it. The future is tough. It requires working against what sometimes seems to be impossible odds. But most people left are really up to it... They really really are.

So yeah, maybe teradesk and xaaes are a bit like children in their development cycles. They have a lot of growing up to do. But the fact remains that they will grow. And there will be no more locked up source. No more walls. No more developers disappearing or greedily locking their code in a vault for no good reason. And you'll be left with not much to say. Maybe you'll mutter some stuff under your breath about how it all can't run on 4 megs of ram, meanwhile current pc's will cross the 2GB barrier for beginning line.

Just remember, MiNT isn't perfect and nobody is claiming that it is. But man people sure do love to open up presents, they love to download new software and they love to see a system evolve before their eyes. It's just nice, that's why people will use teradesk even if there are better offerings currently.

Anyway, I'm so rambling and I have nothing left to say to you. You've lost credibility in my mind a long time ago. Really I'm just bored so I'm saying this for the benefit of everyone. Have a good year
Mark

For every one looking for a method to print out the files produced by ScorePerfect Music Notation Program on a Windows XP computer I'm glad to tell you I finally found this method:

```
cd..
D:
cd Atari_ST
cd PCST048
type parallel.out >prn
```

As you can see, my old Atari_ST program works under the Pacifist program.
It's works good. I use a HP Deskjet 600. This works perfect.
I'm a happy man, since I found the batch-code for printing the files.

It's not a matter of lost time but also a matter a waist of bandwidth.
Also you might consider to place a signature separator. This way people
who reply to your message will not to have to delete your signature
himself.

<quote>

RFC 1036, "Standard for Interchange of USENET Messages", recommends the
signature separator "-- " in section 4.3.2 (Body Conventions):

"If a poster or posting agent does append a signature to an
article, the signature SHOULD be preceded with a delimiter
line containing (only) two hyphens (ASCII 45) followed by
one blank (ASCII 32). Posting agents SHOULD limit the
length of signatures, since verbose excess bordering on
abuse is common if no restraint is imposed; 4 lines is a
common limit."

</quote>

Every _decent_ newsreader (thus not Outlook and the likes) are able to
place a signature separator. So please use it.
BTW: What has MiNT to do with this?

I had a similar problem with Genmeva vs. Alt-RAM two years ago; it was
cured by appropriate settings of program header flags in all auto-folder
and accessory programs, including geneva.prg itself. Maybe I was wrong,
but I got an impression that some of these -had- to be set to use
Alt-RAM if it was declared to TOS, otherwise they would not work well.

Perhaps you should try booting with the barest possible setup (the minimum
needed to boot Geneva), and then try adding other possibly offending
programs. The Alt-RAM board is not currently in my Mega, so I can not
check if this is the only good setting, but flags for geneva.prg
and jarxxx.prg are currently set here for fast load, use alt-ram, but
not malloc in alt-ram. For taskman.acc all three flags are set.
For other important programs such as nvdi.prg or xcontrol.acc all flags
are set as well.

>When booting, the xtraram.prg tells TOS of the presence of extra RAM,

It must also set a "Fast RAM buffer" and its cookie, if it doesn't, you will
have a lot of problems (i.e. you won't be able to work at all); check
whether you get a _FRB cookie after running xtraram.prg (btw. Magic sets
this buffer and cookie by itself).

>From the software end of things it is my understanding this Marpet board

>The board sits in the mega expansion bus and holds 8 one meg simm modules. The
>board has what ever MMU it needs built in.

Are you sure that the power supply of your Mega can handle this? Eight
1MB modules (probably with 8 or nine chips each) are quite power hungry;
When I put an Alt-RAM board with 8 such modules in My MegaST4, the power
supply was operating uncomforably near its nominal limits (i.e. like
100-200mA below nominal load, with the floppy driverunning). To be safe I
had to put a more powerful supply in (a 4-amperes one; I believe it was from
some Falcon - or maybe a Megafile?). Also, with such a large additional
load, the initial voltage regulation setting may not be appropriate anymore;
check with a voltmeter whether you have 5V +/- (say) 0.1V on the motherboard
and on the RAM board. If there is a possibility of overload, try operating
the board with less memory (e.g. 4MB), if such a configuration is possible.
Finally, you may check whether all of that RAM is really working properly,
with some utility that can check it. There is also a possibility of
overheating in the cramped Mega box.

Hi,

I buyed the same RAM-Card also by Mr. Trettin - it's called "MagnumTT"
:-) You can use following modules:

16 MB: 8 Chips, xx1740x
16 MB: 2 Chips, xx6516x
32 MB: 16 chips, xx1740x
32 MB: 4 Chips, xx6516x
64 MB: 8 Chips, xx6540x
128 MB: 16 Chips, xx6540x

Following types you cannot use un this board:

16 MB: 8 Chips, xx1640x
16 MB: 2 CHips, xx6416x
32 MB: 16 Chips, xx1640x
32 MB: 4 Chips, xx6416x
64 MB: 8 Chips, xx6440x
128 MB: 16 Chips, xx6440x

Caution on modules, they've chips with text "HYB31" or there is a "V"
in the text => They're 3.3-Volt-Modules, the MagnumTT runs on 5V. You
shouldn't use them.

Mike

Symmetrical SIMM? Basically, it means a low and even number of chips on
the SIMM. It could also mean a high and even number of chips on the SIMM.

In other words, a four-chip SIMM should work, and a three-chip SIMM should
not work. 12 and 16 chip SIMM should also work.

There is a list of known workable and known unworkable SIMM on the Maxon
data sheet, next to German words for right and wrong.

It should also be designed to run on 5 volts. The 3.5 volt stuff may work,
and may show memory errors. TTL logic has been known to run slowly on 3.5
volts. I have no experience at running fast 5 volt memory on 3.5 volts.

> desktop or sysinfo.prg.

I searched back for and read the complete thread, "MagnumTT Ram Card
and types of Simms". It sounds like getting this card to work is a
bit problematic. I would feel better about buying the card if more
people were having less trouble with it.

Even 65mb would be a huge improvement over the 4mb of TT ram I have.
I would be satisfied with 65mb but it sounds like something is screwed
up if the whole 256mb is not showing.

Can you remove one stick of memory and see what happens, or does the
card require both sticks to be in place?

>off you go.

There's no IDE cable and no brackets. I didn't like having to open it
up, but it's of more use with an internal HD, and probably could use the
14Mb RAM upgrade anyway!

So, either: Has anyone got a 2.5" IDE and brackets/cable for sale, and
ideally, a RAM upgrade from the standard 4Mb.

Or: Anyone interested in a boxed, as new (sadly, now opened to check
inside, but very carefully closed again) with no discolouration or wear
on the keyboard/mouse/casing, totally stock 4Mb Falcon? There's really
very little I can do with it without the HD/RAM and no monitor (my STE
has a Mono display and runs a Mac emulator).

I've hooked up an external CD-ROM and SCSI drive enclosure and plan to
do some digging on the net tonight for the utilities to format the disc
(either a 2.1Gb Fireball, or a 330Mb Seagate), then I can burn some
downloads onto CD using one of the Macs. IIRC the Falcon could read
ISO9660 no problem, at least on my old HD/Syquest/MiNT setup.

I'm wondering if the Falcon will boot from an external SCSI drive,
though. It doesn't seem to check it.

You never know... I thought my 36 MB RAM would be enough. Think of it,
just 4 MB less compared to the whole harddisk on the Stacy I've used for
many years...

But, with Calamus and high rez colour images a document can easily
grow... With a 25 MB .CDK the disk swapping slow things down quite a
lot...

Rodolphe,

I did contact you a while ago, just look back a month or 2 and see my posts here, everyone indluding yourself said make sure the CT60 is updated, which it was uptodate when I got it, then it drifted onto kits and things to update it and I just left it, ive spent enough without paying more for to update the thing also. Since it was all down to updating I just left it since I would probably never get around to it anyways, which is not the problem. Theres some odd almost random problem since in CT60 mode my falcon crashes at random and I really dont have time to sit debugging half the falcons electronics to find out why. The updates only seemed to be the problem with what everyone said, since I already had them nothing became of it after that, Oh, I did buy probably the best stick of ram for it also, but that didnt help. I need to try a new PSU, though it doesn't look like thats likely to cure it. I need to put me falcon back together really, I want to transfer all my 720's over the NEClink project to my PC, I can't remember the correct name for it, but its still going great ;-)

I have a pretty cool PC, though since there will be "probably" no more
"atari's" I brought a CT60 since its probably the last thing which will be
done for the Atari scene so having the fastest tos machine to end with is
what I wanted. I hope it wont be the last project, though For me a speedy
falcon will do me just fine!

^^^^^^^^^^^^^^^^^^^^^

I have this exact pair of SIMMs. Siemens chips the whole # is:
HYB5117400BJ-60, 16 chips double sided.

I was told by Niels to try it without setting jumpers as it should auto
configure, but I also tried with jumpers set as per the sheet to no avail.
I guess I have a bad board. Hopefully I can get a replacement from Niels.

Exxos,
Have you gotten your CT60 to work then??? Is it
fitted with or without solders??? Are there any other
accelerators on this Falcon??? What kind of programs
are you running on bootup??? What OS are you using??
I have currently had my Falcon on since 5 a.m.
Saturday morning which would make it around 35 hours
or so. When does the crash occur??? Is there a
specific program that CT60 seems to crash on or is
random?? Please be more specific or drop me a line
and I can help. I had issues with mine but as with
any product there may always be some tweaking to get
it to perform better. With mine, I had to cut the
trace on the board, UPDATE to the latest ABE, SDR and
TOS binary, rearrange the AUTO folder for better
optimization and lastly which seemed to make the
biggest difference switch from 66.666 mhz to 72 mhz.
One final thing to note of interest if you have a
CONTROL PANEL program called SI.CPX rename it SI.CPZ.
I had this in my CPX folder and it was causing
problems with GENERAL6.CPX. Reason being is because
SI has a cache function in it which confused CT60 into
not knowing which to bootup with NO cache or cache.
My system always seems to function more stable with
CACHE ON. Something else you may wish to check into
is whether or not you have all the latest PROGRAMS,
ACC's or CPX's installed for the CT60. This may make
a big difference as well.

Thanks,
Carey Christenson

Martin,
It has nothing to do with MINT. I know that JANEZ
uses MINT so I was telling him if he does not like my
SIGNATURE to find a filtering program for MINT and put
me on his KILL FILE. I dont see anything wrong with
it and if there is a problem with it tell me directly.
It does not use that much bandwidth that it is a pain
in the ARSE. Besides that try and tell that to all
those damn spammers out there that flood peoples inbox
daily with CRAP. That to me is a waste of bandwidth
that can run into some serious Terrabytes hourly.
Especially when you consider that experts believe that
75 percent of the internets bandwidth is due to
spammers.

Thanks,
Carey Christenson

without.....

Are there any other
> accelerators on this Falcon???

nope.

>What kind of programs
> are you running on bootup???

Well none really, I'm a basic GEM guy meself.....

> What OS are you using??

GEM ;-)

> I have currently had my Falcon on since 5 a.m.
> Saturday morning which would make it around 35 hours
> or so. When does the crash occur???

Its at random, I've tried for hours to track down a problem, if you do a
totally clean boot to GEM, and leave it for like 10 mins then move the mouse
it will crash. I can boot and play a mod tune for about 20 seconds before
it crashes. At first I thought it was a CPX causing the trobule , and since
I have a lot of um, I renamed the whole lot and kept rebooting and renaming
until it locked up. Though after hours and hours, it turns out that any CPX
will crash at some point so its not whats running there. I did manage to run
nembench and see great results though that was about it.

>Is there a
> specific program that CT60 seems to crash on or is

> I had this in my CPX folder and it was causing
> problems with GENERAL6.CPX.

Yeah, I found general cpx, and there was a couple of others also which gave a sure crash everytime, though I got updated ones now for the CT60. I can;t use the temp meter in one of the CPX options, it crashes out everytime on temp reading.

Reason being is because
> SI has a cache function in it which confused CT60 into
> not knowing which to bootup with NO cache or cache.
> My system always seems to function more stable with
> CACHE ON. Something else you may wish to check into
> is whether or not you have all the latest PROGRAMS,

> a big difference as well.
>

Yeah, I think im all upto date. It might be my falcon, I did have that awefull Nemesis kit in for a while but I took it out shortly after since I couldn't get stable results and half my games didn't seem to want to work either. Though after I put my falcon back I lost the 3 resistors and a inductor, I did put normal parts there which may be the reason why CT60 is tripping up, im not saying the CT60 is to blame, im just saying it doesn't work on my falcon. It works fine in 030 mode, the only problems I have from time to time is accessing the floppy causes 2 bombs sometimes. So you can see my point that my falcon may not be running correctly. It does run fine otherwise. I was kinda hoping CT60 would bypass any problems CPU end though I guess it was a longshot. I hope Rudolphe and people understand im not flaming the CT60! I think its great though the only cure looks like a new Falcon motherboard to me, which is why I just left it kinda in a heap on my desk ;-)

> up, but it's of more use with an internal HD, and probably could use the
> 14Mb RAM upgrade anyway!

I have an extra 2.5" bracket. If you'd like it, contact me.
I also have a stock Atari 14mb memory board around here somewhere. The 14meg board worked fine on my Falcon until I put a Centek 50mhz kit in it....I had to upgrade to FASTER memory (Wizztronic board, still avilable from them).

I'm out of machine screws that go with the 2.5" bracket, but I'm sure you could find them at your favorite electronic supply store.

You could also make an adequate basket or mounting plate yourself out of good stiff wire or thin sheet metal without much fuss. Could even just turn the thing upside down and screw it right on to the RF sheilding.

The cable is a standard 'internal' laptop IDE ribbon cable for 2.5" drives. Another option is an inexpensive plug-on PCB by Wizztronics that in turn has places to plug in either, or both 2.5" or 3.25" IDE drives with standard female to female ribbon cables, and a power tap for the 3.5" type drives. They might also have the larger bracket kits if you ask.

I think I still have my origonal 80mb conner drive here somewhere...it should still work on a stock falcon...it was just way too slow for the CT2B. No cable, since I'm using that still....but again, contact me if you'd like to have it.. It is the 2.5" type drive, which gets its power from the IDE ribbon cable.

> Or: Anyone interested in a boxed, as new (sadly, now opened to check

> on the keyboard/mouse/casing, totally stock 4Mb Falcon? There's really
> very little I can do with it without the HD/RAM and no monitor (my STE
> has a Mono display and runs a Mac emulator).

You can indeed get an ST adaptor plug and use that Monochrome monitor with your Falcon. Pretty much ANY Atari shop can supply this item, either from old stock, or coustom made in house. Usually around $15 US. It's not a hard item to make yourself either, but unless you happen to have the parts laying around already (the 13pin round plug, while not impossible to find, is likely to be hardest part to track down, particularly the female socket, which is what you need), you won't save much if anything building it yourself...so unless you have the stuff handy already....I personally suggest to buy ready made.

The Falcon can also use a VGA monitor with a different adaptor block.

I'd be interested if you'd like to sell it.
How much?

> I'm wondering if the Falcon will boot from an external SCSI drive,
> though. It doesn't seem to check it.

Yes indeed it should be able to boot from SCSI. Only problems I ever had
booting a SCSI only Falcon were with CT2B and MagiC....and there are workarounds
for that. The Falcon isn't going to scan either the IDE nor the SCSI bus
without some software either run from a floppy, or initalized on a boot sector
of a TOS compatable partition.

Did your Falcon not come with some system disks?
It is my understanding that all Falcon's shipped with 2 or 3 system disks
including things like hard disk drivers, TOS patches, print spooler, MultiTOS,
some accessaries and a game or two. If you don't have these, again, contact me
and I'll be happy to send archives of the stock Falcon System Disks.

I'm not attacking CT60, I think you have done a great job in producing the
CT60! I'm just saying It don't work in my falcon, I posted some comments
elsewhere in this thread also. I can only assume my Falcon is faulty in
somewhere, which is probably the case, theres not much I can do about that
until I find some time to check it out.....

Chris,
If you believe that your Falcon MOBO is bad since
the parts that you put back into it after taking the
NEMESIS out may not be the same as what come stock. I
would e-mail Rodolphe and have hime take a look at it
and get it running for you. He is the best in the
world at getting a Falcon running. If he cannot get
it going then it is probably unrepairable. But it
quite possibly looks like there maybe something with
the NEMESIS deal. This is why I asked if you had had
any accelerators on this Falcon at all. Because if it
was not a stock Falcon to start with this could pose a
problem even for a middle of the road solderer or even
a more experienced person as well.

Thanks,
Carey Christenson

Why not send the bird to a well equipped Atari work bench?
I know it's not cheap, but there are a few places left with the equipment and knowledge to rework your Falcon. Rudolphe might personally set it straight for you? If you talk to the right person at Wizztronics, and make it clear you don't mind paying the minium bench fee, they'll still work on Falcons as well. I know it's not cheap, but I've yet to get one back from these guys that wasn't fixed to origonal specs (or altered specs if it's clear what you want/need).

In theory, if you have a Falcon that's running on all the scopes according to the factory specifications (including Atari Authorized/Recommend patches), your CT board should just plug right on and purr like a kitten. Right?

Steve at Wiztronics is really good about staying in touch, being honest about what needs to be done, the time/parts involved, and letting you know if something 'really expensive' pops up before pressing on and billing you. Sometimes they have a slow turn around, but they do it RIGHT.

All that aside, might you be interested in selling your Falcon and or CT60?

Brian

The falcon I got was a stock falcon from new, I latter added the nemesis kit in, though it did work at 20mhz it was unstable at 24mhz, some programs messed up on video so I took it out. the falcon does work find, though its probbly the parts I put back in, I've got the diagrams for the falcon somewhere, I will have to try and sort out some of the correct surface mount stuff. Having played around with my own built circuits Its supprising what even a small 1" length of track can do to a signal line, Its just a guess that this is the problem, though it is a very much possible cause.

cheers,
chris

Wiztronics have a good rep, I dont think anyone has ever had anything bad to say about them, well maybe that they kinda dont do much Atari stuff now if any ;-)
in anycase, ive spent around 13 years in the electronics field so repairs are pretty much fine in general, actually people should be able to tell im a engineer cos I cant spell for one thing ;-)

and to answer your question, theres no way id sell my falcon, so far I have a have what seems like all forms of the ST, plus the classic 2600 consol and the jag, with my falcon it makes a nice collection for sure. I do have plans to do more projects with them, but as always time is VERY limited :(

Cheers,
chris

389. Mega 4/Notator and dodgy MIDI

Newsgroup: comp.sys.atari.st
Date: 2004-01-18 22:45:06 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <P2EOb.7471$%86.398@bignews4.bellsouth.net>
Source record: 21578

I've a Mega 4 with Link 97 and HDDriver 8.03 that I've been using for Notator SL.
It has run perfectly for ages.

I recently put an Xtra RAM board in it, and upgraded the TOS to 2.06.
I ran it a few sessions since with no problems.

Now, out of the blue, the MIDI flow is just all screwed up. Notes cut short, hang, and boggle to heck and back. This is playing live via MIDI thru, or when playing back sequences that worked just fine for ever and ever. These problems persist with any of the inputs/outputs, including those from Unitor II. Have checked for loop back possibilities and eliminated all possiblity of this.

XOR, Sample C, Avalon, Zero X, etc....
None of these can do a sample dump at all any more. I get all sorts of error messages about time outs and deviant data.

CuBase 2 and CuBase Audio Falcon work much better, but it's still dropping data that was never dropped before.

I've checked and changed all the MIDI cables, run my MIDI patch bay through vigorious tests...bypassed the patch bay all together...every thing I know to check! With the same cables/patch bay, etc....Falcon and STacy work fine.

Totally clean boot...no accs....Xtra RAM disabled, etc....
Even stepping back to the old TOS.

Tests to all Memory, ROMS, hard-drives etc, yeild no errors.

I'm at a loss as to what could be wrong.
Any ideas?
I'll try the obvious...removing the Xtra RAM and TOS upgrade if need be, but I'm hoping I've missed something simpler.

Thanks,
Brian

390. Re: Geneva & Extended RAM

Newsgroup: comp.sys.atari.st
Date: 2004-01-18 23:18:00 UTC
From: Brian Roland <BJRoland@bellsouth.net>
Message-ID: <yrEOb.19859$0t4.3456@bignews5.bellsouth.net>
Source record: 21579

I finally found a way to get Geneva to run with this Xtra Memory.
1. Disable extra.prg in the auto folder all together.
2. Run the Xtra.prg from the desk top once it's booted.

NeoDesk still never sees 'alternate RAM', but programs with proper flags find their proper memory and so far, seem to function as they should.

So far, where Geneva is concerned....it's just not happy if Xtra.prg runs from anywhere in the auto folder. The drawback is that things like NVDI, STing, etc....are going to ST RAM....and those are the sorts of things that are really nice to have out of the way in alternate RAM so there's lots of room for those 'legacy apps' that break in anything other than ST RAM.

> Are you sure that the power supply of your Mega can handle this?

I'm glad you brought this up....
I currently only have 4meg installed in the Xtra RAM board.
I don't have any internal disk drive other than the stock 720k Atari/Epson Floppy.
The Link 97 gets power from the SCSI bus....

All the memory tests report well functioning RAM, both ST and Alternate.

I have noticed however, since installing the new TOS 2.6 board, and the Xtra-RAM board, the screen sometimes 'blinks' really fast at random and unpredictable moments. I don't think it's an AC power surge since I don't notice other computers and machines on the same circut blinking along with it.

Could a weak power supply also cause deviant MIDI transmissions? As this Mega ages...I find more MIDI errors. In fact, it's gotten REALLY bad lately....esp with things like SDS sample dumps and system exclusive data that all worked fine in past years/sessions. I know the MIDI cables are proper and aren't dodgy...have tested them extensively....and they are good SHORT cables with truly independent 5 wire leads (not audio DIN cables where some pins share a wire or are shorted).

It's mind boggleing, because every software based system test I can get my hands on reports a healthy machine, yet I get serious problems with MIDI that only get worse each time I power up the Mega..

The least you could do is to actually make it a _real_ signature with a
proper delimiter so people who respond don't have to delete everything
manually.

You are not alone with lots of Atari stuff and if we all put a complete
list in all our posts this would be a much more unpleaseant NG.

It's really disturbing when you do a search on Google for information on
some equipment and all you get are the same lists all over without any
related useful information.

>me on his KILL FILE. I dont see anything wrong with
>it and if there is a problem with it tell me directly.

When it comes to asking qestions it's a bad thing to be in too many
killfiles, and those with most knowledge will likely have you blocked
first.

> It does not use that much bandwidth that it is a pain
>in the ARSE. Besides that try and tell that to all
>those damn spammers out there that flood peoples inbox
>daily with CRAP. That to me is a waste of bandwidth

Agreed, but IMHO you are actually adding to the textual pollution in this
NG and my _visual_ "bandwith".

Readers of a NG's tend to go through posts quick and if the amount of
relevant text is small they might miss what you really have to say.
That's also why proper line lenghts, formatting and qouting is essential
to get your message through.

A tip: Put up all your gear on a website with images and everything, and
just add a link to it in your SIG. That would make all happy.

Sorry about the screwup, I didn't intend to post this into that old
"MagnumTT Ram Card and types of Simms" thread.

In article <bsaanp$5p0$1@reader2.panix.com>, Jim DeClercq
<jimd@panix3.panix.com> wrote:

> My experience has been satisfactory, but imperfect. I got a few Magnum TT

> responded. One had 128 MB SIMM, so I ordered some of those. Plugged two of
> them in, put it into a TT, and only 65 MB was recognized, by either the
> desktop or sysinfo.prg.

I searched back for and read the complete thread, "MagnumTT Ram Card
and types of Simms". It sounds like getting this card to work is a
bit problematic. I would feel better about buying the card if more
people were having less trouble with it.

Even 65mb would be a huge improvement over the 4mb of TT ram I have.
I would be satisfied with 65mb but it sounds like something is screwed
up if the whole 256mb is not showing.

Can you remove one stick of memory and see what happens, or does the
card require both sticks to be in place?

Source record: 21584

I can't find any useful resources online to get my Falcon up and doing
something remotely useful. Just thousands of pages with dead links,
missing files, and a general lack of usefulness.

What I want to do:
Format an external SCSI disk.

What I've tried:
Download of SCSITools found in a forum link. Bunch o German error
messages, nearly threw Falcon out of window. Most recent.
Download of AHDI et al. Didn't see disks. Now sees disks, but no menus.
Can't actually do anything with it.
Download of ICD. Needless to say, doesn't do anything.

HDDriver is all well and good but it's 35 Euro for something which will
format my drive to make the Falcon useable enough to work out if I want
to spend 35 Euro on something.

Can't find disk images of MultiTOS and don't have any disks other than
Language and Extras.

In other words, AAARGH!. I've written about six boot disks, tried two
HDs, several IDs, and I'm annoyed.

Anyone want a Falcon?

Richard

Hi Joakim,

>From my experience, ppl very rarely get flamed for having a certain
>opinion, but rather how they chose to express it.

You are absolutely right of course, but unfortunately there are some exceptions here, if I for example keep posting to this thread or related ones, you'll see a bunch of people come crawling out of the woodwork (it's actually already happening). And the peculiar thing is that it doesn't even matter if I agree or disagree with their views. How I express my views is secondary really, in certain threads I've walked literally on egg shellls trying not to hurt anyone his/her feelings, but it's all been in vain.... but then that's what CSAST is all about really, the Google archive doesn't go back far enough in time, but the "old timers" without any doubt know that one expressing his views here, has always been a tricky business. If one goes against the mainstream opinion that is.... :-(

I've constrained myself the last couple of weeks, but now it's about time to let off some steam :-)

I've seen some nonsense posted here the last few weeks that really top everything, and what amazes me even more is that everyone seems to agree with it... so does it surprise you that *once again* I have a slightly different opinion?
"Moving on" all of a sudden means getting a Linux based PC on which an emulator capable of running MiNT does its thing in order to run ported Linux stuff.... Now, am I loosing my marbles or is the MinT community really going to the dogs? That's the one million dollar question ;-)

To be continued....

Cheers from Belgium
Dennis

>be addressed?

Could you explain to this community how something which is not
supported *and* not implemented possibly be a bug? The year has
only just begun and here you are spewing your usual rubbish...

>The idea is that a toolbar would save a lot of custom gem
>coding, but then to get around the fact that ONLY magic don't
>handle toolbars I'd have to implement a bunch of custom code
>just to simulate this under magic. Sort of defeats the purpose
>in the end.

From what I've seen so far other programmers managed just fine...

>Major flaw if you ask me.

I don't recall anyone asking you anything, if this is an example
of what you are going to serve us here in the coming year, then
we're going to have lots of fun....

I can spew rubbish and degrade your work just as easily; when are
you going to address the Iconnect bug in aIRC? Following your
logic anything that isn't supported or implemented is a bug, so I
found a bug in your program :-)
How's that for contributing ? Don't forget to mention me when you
release the bug fix....LOL

>many ppl develop anything for Ataris :)

That 5% (mind you it could just as well be 4- or -6%) are simply sloppy programmers, the kind that doesn't check if their app runs on the three major used OS's. Mind you... I'm talking about Atari apps here, you know, the stuff that is created *on* this platform *for* this platform. The so-called unix-ports are excluded from this, there's a distinction after all between programming and porting right? ;-)

Cheers from Belgium

Hi All,
In order to copy a 13 meg wav from/to the same hard drive or from a
CDROM drive I had to set HDDriver 8.04 FAT/Data to 20/250 which ate 4.4 meg
RAM. Less than that caused a system hang with the hard drive light lit
steady!
Switching back to 7.9 I found that 10/100 was good to copy a 40 meg wav!
This comes after nights of switching cables, IDs, and combinations of
new and old hard and CDROM drives and long distance calls to the dealer of
the new hard drive! Am I having fun yet? :)

Uwe, is there a bug in 8.04 or is it showing up a problem that still
exists in the system?

John

It still looks like a cable/termination problem to me. Remember that the
GEMDOS cache settings are not relevant when HDDRIVER is reading or
writing data, because the caches is only used internally by GEMDOS.

I suspect my Falcon's previous owner has been somewhat careless with
disks. I put the language disk in the machine and discovered it contains
one file, "I_STRIKE.TOS".

Would the language disk have the AHDI utils on it originally?

I downloaded MultiTOS images, but they don't include any utils (and for
some reason, Disk 1 doesn't wish to boot properly despite both disks
being written the same way).

Richard, now trying to find images of original language disks.

410. Re: Mint Advice

Newsgroup: comp.sys.atari.st
Date: 2004-01-19 10:50:04 UTC
From: Dennis Vermeire <dennis.vermeire@gmx.net>
Message-ID: <1074628666-435887AEicMi@gmx.net>
Source record: 21424

From: Janez Valant <swe@atari.org>
Date: Sat, 17 Jan 2004 14:29:18 +0100

Hi Janez,

>Other very big advantage is flexibility: use Xaaes, if u dont like use
>N.AES. there is also new VDI in making and as it seems it will be very
>good. And of course portability of MiNT itself. U have 030, compile 030
>version, or 040, or 060. If we ever (i hope so) get ColdFire machine or
>PPC or whatewer, MiNT is ported easy...

Nice reasoning... :-)
But there's one flaw, you (well, most people actually) forget the latest incarnation of MagiC. Ever heard of MagiC-Milan? Unlike the other MagiC versions this one is constructed & programmed to allow an *easy* to port OS also, just like MiNT this version uses certain parts of TOS, I would say if that Coldfire machine ever makes it (which I doubt), MagiC would be the logical choice... a lot lot of work went into developing MagiC for the Milan II vapourware, including some nice goodies like USB 1.1, PCI 2.0 and AGP 2.0 support. And yep *I know* that there's a flaw in my reasoning as well, MagiC is a commercial OS, so before it would ever be ported over a certain number of users must be guaranteed, although if for example only 100 people would show an interest in a new clone, then it certainly won't appear of course. That's where the advantage of MiNT comes in play, it doesn't really matter how many people use a certain system, it'll be ported over even if there were only 50 users.

>Main disadvantage, esp for ST users is RAM usage and speed, esp on low
>specs machines. Magic is more compact, and more close to hardware and on
>4mb or less systems perform great. As do Geneva, but Magics AES is a lot
>better. Sadly, reason for Magic compactness make it realy hard to port on
>some less compatible machines.... So on machines with less as 14mb, MiNT
>will not feel nearly as good as Magic.

Yes and no... MagiC indeed is a little friendlier on smaller systems, but a full blown system garbles up a lot of memory also. When I boot up the TT under MagiC some 9Mb disappears - that's rather extreme - I agree, but then what's the use of running a multi tasking OS when one constantly have to keep an eye on available memory?

> Which only leaves unix portability....
>
>Yes. Altough i would wish u wont refer to that part as unix portability
>only. Its not just that. MiNT allows (and thats why i like it over linux
>and so) that even plain GEM apps benefit from Unix domain. Also, porting
>of apps like OpenOffice is imho still not too real, since those apps are

>quite big and to expect them to run on 030 or even 060 is a bit naive
>imho...

I agree, but then wouldn't it be possible to for example only port a part over from a monster like OpenOffice? Michael Freeman was spot on when he said that we lack a presentation program, a Powerpoint clone would be just the thing that some people here are looking for. IMO it's not necessary to port over the rest of the suit, as far as text processors go we don't have anything to complain about really, Texel will take care of spreadsheets issues and Phoenix will solve most database related problems...
Also, I know it's human nature --- why do people always try to port over the very last (bloated) version? Take the Mozilla browser for example, the latest versions are just as bloated as Openoffice, but what about for example version 4.xx or even 3.xx? These should run quite nicely on Hades, Milan and expanded Falcons... and compared to what's available right now on this platform, a port like that would really mean "moving forward" for a lot of people. They've been ported for Mac 68xxx based computers, so I presume that some of the hard work involved is already done?

Cheers from Belgium
Dennis

John Garone wrote:

> Sorry I don't understand. Why then would 40 meg copy ok with ver. 7.61
> and 13 meg hang with 8.04 (same FAT/Data set)?

Because it has nothing to do with these settings at all, but with the
SCSI bus in general, i.e. termination/cables. I have no idea why it
actually works at all if you change your FAT settings.
Remember that HDDRIVER 8 uses more SCSI signals than 7.x, in order to be
more compliant with the standard. So if something is wrong with the bus
HDDRIVER 8 will notice things HDDRIVER 7 might not have cared about.
I think I already mentioned that SCSI_MON can provide more information,
but in the end I do not see another explanation than your bus not
working properly.

And again, determination and bloody mindedness win through. Finally
persuaded SCSITools to see the drives, even though AHDI wasn't able to,
and set them up. Got MultiTOS installed.

Now I have a Falcon with 2 HD partitions, which may or may not be
properly configured since I don't understand German, but it appears to
boot fine ;)

ok! Thanks for that explanation. So, I assume that since I checked
termination on 2 hard drives (installed either one) and swapped out cables
then either both sets of cables or hard drives are bad or the problem is
internal in the Falcon!
On a similer note, I mentioned that Doom would crash upon loading if
HHDriver was installed but not if ICD was used to boot. Doom works now with
HDDriver 7.61 so again I assume it's the same bus problem!
So, I'm off to get SCSI_MON and see from there.

Thanks again,
John

> doesn't seem to work very well, or is it just me who seems to think this?

All accellerators are tricky. The CT60 is actually very easy to
installed compared to other accellerators such as CT2 and Afterburner.

And, it is very cheap.

Generally, the CT60 very compatible and fast. Lots of bang for the
buck.

Just get a IDE Laptop HD around 5 to 10GB and a IDE cable and you are set! Would prolly need an updated HD driver program. You might already have the cable and cradle in your falcon. Have you checked?

I have an app that must be run off of a floppy disk that will do this very thing.

You have to insert the floppy, switch on the system and toss it off a high building, if when it lands you get a turd like splat on the ground then it was an Amiga board.

Hi all,

Does anyone know what pins to check for when the CPU is say accessing RAM or Video or External devices ?There must be some form of chip enable pins or something ?!

Cheers,
Chris

Hi Mark,

Mark D wrote:
> Your fpu software in any of the configurations that you gave me did not
> solve my apparent fpu problems.

Did you try FPU060.PRG alone at different places in the AUTO folder ? In facts, I didn't realized that you already had a FPU emulator. Recent programs when they are compiled with -m68020-60 GCC option don't need an emulator. FPU060.PRG is not useful for those programs. But it can be used in your case ... If your FPU problem comes from there ...

> What is really strange is this....
> Older version of lame that was sent by evl or swe in irc resulted in bad
> mp3, encode time 2 hours for 40 meg wav, 128kbit CBR - using fpu?

> Latest version of lame compiled -m68060 with fpu, good mp3 encode, time 24
> minutes, 40 meg wav, 128kbit CBR.

Well, recent programs are compiled with recent GCC, and don't need an emulator (-m68020-60 option). In this case, even if FPU emulation is bad, the program will behave correctly. To be simple, recent programs are designed to fit with 68060 FPU.

Did you have problems with older programs only ? Is there some recent programs that behave badly ? In fact, this mode of compilation works only since 2.8.1 version of GCC (It's me that reported the bug ...). FPU programs that are compiled with PURE C are all wrong, if your FPU emulator is wrong.

> Software compiled with -m68020-60 works fine for me including
> openssl/openssh. Never experienced a crash on any of that stuff. Only
> thing that has crashed for me ever is gaim, and gcc. Sometimes I get a
> system freeze after having about 50 bus errors with the prior 2 programs ;-)

Well, I told you the reason ... You should really do something with FPU060.PRG ...

> As you can see: 1) my fpu cannot be so broken... can it!?

No, it's not. That's only the FPU emulation that is bad. It can easily be corrected. That's my opinion when I see what effects you're telling me about.

> 2) compiling
> with -m68060 works REALLY well even on gcc 2.95.3,

I'm sure it works. But the drawback of 68060 compiled programs is that
they won't work on a 68030 processor (TT, Falcon). You should better
use the -m68020-60 option of GCC. The generated code is then a 68060
code, but the code is then compatible with 68030+68881 code. That's
better.

> and 3) perhaps this
> fputest isn't good for 68060.

Well it is pure 68030+68881 code that require a good FPU emulator.
There's no reason that it wouldn't work with a CT60, at all !...

> Can anyone PLEASE make sure this fpu test is good.
>
> The archive is at:
> ftp://ftp.lip6.fr/pub/atari/Utilities/fputest.zip

Well it works totally right with FPU__3.PRG that I told you, on
my Hades 060. There's no reason that it doesn't work on a CT60.
Keep out of your mind that the FPU is broken ...

> When extracted the test in question is the ACCURACY test, fputest.tos.

> they don't want?

Well, just try FPU060.PRG. This should be helpful. Please stop to tell
about a hardware problem. This is not the case. You have two solutions.
You can compile your programs with a good math library, and the
-m68020-60 option of GCC. The other manner is to use a patch to the
FPU emulator. I really doubt that there's no solution to your problem.
It is quite simple for me !

432. Problems getting MIDI working

Newsgroup: comp.sys.atari.st
Date: 2004-01-19 22:03:44 UTC
From: matt <greatbigblackhole@hotmail.com>
Message-ID: <buhk22$3sm$1@pump1.york.ac.uk>
Source record: 21514

I'm trying to hook the MIDI out of my Atari 1040ST up to the MIDI in of a Soundblaster Live card. I'm using a 5 pin - 5 pin lead to go between a keyboard and the atari - Cubase receives the signals fine, and with MIDI thru on it shows the same signals being output. I have the Atari connected to the PC with a game port D connector to a 5 pin din on the Atari MIDI out. I can't get any signal in on the PC. SB Live Keyboard should just play the notes shouldn't it? Just like it used to with the Dtype - din lead directly between keyboard and PC. I have also tried Cubase on the PC with no luck.

My only worry is that the PC is firing voltage out the MIDI connector into the Atari, and that might be screwing it up?

thanks,
matt

Have u taken a look at the RGB To NTSC converter that was posted in an
earlier post?

http://www.preromanbritain.com/gwem/martbean/ataridiy/conv.htm

Practical Peripherals had such a beast out in 1988, along with
a slew of other companies. I have never seen any of them for sale
though, neither in this newsgroup nor on ebay.

438. Building ST RGB to NTSC device

Maybe yes, but it is simply impossible to make diagnostics by email or
newsgroups. Doom might simply do something illegal when using the BIOS
calls for reading writing sectors. Or it might fiddle with the DMA/SCSI
interrupts for some reason. HDDRIVER 8 uses interrupts unused by
HDDRIVER 7, again in order to be compliant with the SCSI standard.

Yes I tried fpu060.prg at many places. It works alone (without
fpu__3.prg) but it doesn't seem to do anything at all. Whatever fpu
problems exist are still there (incorrect calcs). I've tried switching a
number of things around and every thinkable combination of fpu060.prg and
fpu__3.prg, and mostly fpu__3.prg just causes everything to crash. This
is even with my new ability to turn the fpu off on the 060 period, which
these two programs seem to like even less. No matter what I cannot get a
good result.

Then how come gcc by itself with -m68020-60 or -m68060 don't behave
properly? That is to say gcc is compiled itself with -m68020-60 or
-m68060, both versions 2.95.3 and version 3.3.

Okay - then well we have a problem because it certainly doesn't work on
mine or Keith Scroggin's falcon. Maybe it's a deal with America? (He's
in the USA too). Maybe I should use PAL instead of NTSC ;) You really
never know what settings might affect certain things.

Well it doesn't work on the CT60 so we're back to square one.

Perhaps someone can make a quick accuracy test that ONLY uses 060 fpu
instructions. Then we can see if the raw fpu of my 68060 is fine.
Otherwise then we can make one that tests emulated instructions. And see
that the emulator is broken or whatnot.

>

Fpu060.prg does not help in any way. It makes absolutely no change. So
perhaps my fpu problem is a hardware issue. I've tried many many configs,
I cannot get good fpu calcs somehow. Yet some fpu apps seem to run
great.. Okay eureka for instance produces perfect calcs it seems.

Thanks,
Mark

You probably wont find a direct connection from the CPU, while its possible that modern PC processors have the address decoder built in older systems derived the chip enable signal as follows...

Usually the upper address lines are to determine which device (RAM, ROM UART) are enabled. These address lines are used as inputs for the address decoder.The address decoder chip activates only one several outputs at a time as determined by the states of its input lines where each output is the chip enable line for different addressable device(s) within the computer (RAM, ROM and UART, Video Chip or other device depending on the design) thus ensuring that only the relevent device is active while being addressed. The remaining address lines determining the actual address location within the device.

So look for the address decoder chip, if you can find a circuit diagram on line it should not the to hard to find as the enable lines for all the addressable device should lead back to it.

hope that helps,
Stephen Moss

Interesting additional followup, now that I am using a test TOS version that allows me to disable the 060 fpu, after a long time of compiling instead of getting bus errors now I get illegal instruction meaning maybe gcc is crashing only when there's an fpu instruction used and only fpu instructions are used rarely.. and perhaps it creates optimizations on the fly and doesn't decide to use the fpu each time which is why it crashes at different points. Or maybe I'm crazy ;-)

I turned off the fpu and ran eureka with fpu support. The program ran fine and I drew quite a few graphs. Perhaps this program has built in fpu emulation for when there is no fpu present? I would think it would give illegal instruction like the others. It would seem there is no fpu emulation in gcc for -m68020-60. It seems more like maybe it only uses instructions common to the 68020-060 and avoids incompatible 68881/2 instructions. I'm likely to be wrong on that however.

I ran lame-3.95, that I compiled with -m68060 support.. illegal insutrction, immediately. This is the one that produced perfect mp3's! The one that swe sent me that produces crap mp3's however works????! Meaning it does not utilize the fpu.. Okay why are the mp3's coming out BAD!?

The fpu-test program that I showed to everyone gives illegal insruction. Nice thing about being able to turn off the fpu is being able to see which applications are using it and how often. It's interesting because lame produced a perfect mp3. That makes no sense, fpu is working??? but the fpu-test program produces incorrect calculations. Maybe lame uses it in such a way that the results can be skewed and the resulting mp3 still sounds okay. And of course gcc is more picky. In my case, I suspect that if I pass this fpu test my gcc problems could disappear.

All of these tests I am running are extremely inconclusive. I can't seem to get solid results that point to a definitive failure of any one component. Things are so strange.

Thanks,
Mark

Well, FPU__3.PRG is designed for the Hades. I'm not really surprised
that it doesn't work. But FPU060.PRG is a 68060 patch, no matter what
type of machine it is running on ... If it doesn't work in the AUTO
folder, then you can try to launch it from the desktop. If it works like
that, you could launch it from a startup script, like MINT.CNF or
in the startup directory if you are using MagiC ...

>>Well, recent programs are compiled with recent GCC, and don't need
>>an emulator (-m68020-60 option). In this case, even if FPU emulation is

> -m68060, both versions 2.95.3 and version 3.3.

Well if I understand what you say, if program are compiled with those
options, and they don't work, the problem comes from the mathematical
static library that has been used. Keep in mind that the math library
(I personally use various one like PML, LIBM or CEPHES lately) must
be compiled with the same switches. The better solution is to compile
it yourself. That's what I've done. If the math library contains
68881/2 code, it will not work at all ! Do you understand ? Another
thing is that math68881.h should not be included. It contains inline
68881 code that will not work. That's rather complicated, but I now
understand a few things. If you take some FPU programs from my WEB
page, they will all work properly.

>>Did you have problems with older programs only ? Is there some recent
>>programs that behave badly ? In fact, this mode of compilation works
>>only since 2.8.1 version of GCC (It's me that reported the bug ...).
>>FPU programs that are compiled with PURE C are all wrong, if your

>

> Hrmm.. i can try octopus but I don't know if it would have any fpu
> instructions in it. But I know I compiled an 030+FPU version of that with
> PUREC.

Well, it won't work then. Except if you have a good 68060 FPU emulator.

> The code that I'd generate with -m68060 would be for personal use on my
> machine and other CT60/Hades users.. that's all.

Then, that will not be a problem for other users. I personally
use my proper MPEG 1/2 encoder, that is compiled with -m68060
option, and it works great !

>>For me I went up to 50 000 iterations without a single problem.
>>That's a good test !
>
> Okie. You're one of a few people now that report it running okay, versus
> only 2 that don't, me and another american.

Well, I have a good FPU__3.PRG, but it is not helpful with CT60

> Fpu060.prg does not help in any way. It makes absolutely no change.

Try to launch it from the desktop ...

> So perhaps my fpu problem is a hardware issue. I've tried many many configs,
> I cannot get good fpu calcs somehow. Yet some fpu apps seem to run
> great.. Okay eureka for instance produces perfect calcs it seems.

Eureka FPU version doesn't need an emulator at all. It is compiled with
good switches, and uses a good math library. You shouldn't have any
problem either with 68060 version of POV that is available on my WEB
page.

But it is very annoying that you can't get a good FPU emulator to
work :-/ on the CT60 ... It really should be patched !

Best regards,

Source record: 21529

I assume you are Chris Sw..... ?

Hello,

I see you are in UK, correct ?

It seems I sent you the CT60 not a long time ago...maybe 2 or 3 months...
ABE & SDR chips are the lastest version...? hum not sure !
Did you do an update with a cable (if you get one sure) ?
If not, please send me your CT60 !!
I will change SDR 5D to 5E ! This update is needed for an IPL (INT) problem
possible with some 68060.
I think I shipped your CT60 with the 5D version...so this is a first way to
explore !

Second, some 060 don't support the clocking at 66 MHz ! I will do full tests
to see that.

Third, when sure about ABE, SDR & 060, the last point to check is the
motherboard...

OK ???

So, now please send me back the CT60 + 060 + SDRAM.

And we will eliminate the first 2 source of problems...

The ball is at you now !

Keep in mind that all people that asked me help and sent me the products (CT
or mb or both) have now a good system.

As you want now ;-)
UK is not far to ship a board ...

Regards

Hello,

I found and ordered the 060 full I need to ship the last CT60.

I will ship immediatly 4 CT60 + 060 and the last 14 have to be checked.
As soon as a CT60 is checked it will be shipped until the last one.
I'm sorry for the delay, especially for these last 18 CT60.

Regards

1. Noone never called MagicNet a hack. In fact lots of people were really amazed by this.

2. MiNTNet is just a kernel module for FreeMiNT. It is a module becose not everone needs it, and the philosophy behind it is: do not waste memory if not needed. So if you do not need it you can save those few kbs of memory.

I'm 23 today, am I old?

> There is one Magic and about 400 Mint variations.

There is no 400 Mint variations.

Lets name them all:

MintOS (old, outdated)

KGMD (old, outdated)

KEMD (old, outdated, it is in fact KGMD, translated into english snd
slightly updated)

Debian-MiNT (old outdated, interesting effort by NoCrew_

SpareMiNT (mantained, but not easy to install)

EasyMiNT (mantained, in fat it is SpareMINT with some extras that make it
much easier to install).

If you are a newbie, stick to EasyMiNT.

Steve, please stop this false propaganda.

General usenet netiquette rule is that signature should not be longer then four lines, and should start with "-- " so news programs may cut it automagically when responding. Not following this rules may be considered "rude".

Amazing what you can do with 8MHz versus 1MHz... ;-)

My God!!! I've just done some research and it seems that you are right...
Both ST and C64 have a CPU, RAM , ROM, Sound chip, keyboard, both are made
of plastic - the list of similarities is endless!!!

Incidentally, I loved my C64, it was a great machine at the time. I really
liked my Atari ST but although it was a better machine it didn't have the
same *magic* somehow.

Speeder.

Well so there we have it.. the ST is not a C64. :)

Besides, the 1MHz was one of the reasons I thought the C64 sucked. My CPC did 4MHz and even the crappy processor in the C64 was capable of more IIRC.

Others were the keyboard (even worse than an ST), slow tape loading compared to other systems, separate text/graphic mode, the silly thing with the capitals and the graphic symbols, the disastrous BASIC and and and... :)

Maurits.

The Amiga blew the ST off the planet, superior technology again plus it was
applied intelligently.

Anyway SID vs YM... SID is a clear winner.

limited grpahics chip, the single tasking OS, the lets rush this out the
door before Commodore releases the computer we should have had, but lost
because I wanted to sqeeze the last drops out of Amiga coporation... Doh!
The ST should have been called the "RC" - Revenge Computer, lol.

Don't get me wrong, I like and own (several) STs, but when the C64 is being
bashed I need to counter... :)

Have you heard recent YM songs with socalled "SID-voices"?

YM in ST can do better then SID.

btw. I do not say that SID is bad, I'd really would like to see SID instead of YM in ST.

I was actually talking about the C64 but so far all you add is correct. ;)

> the lets rush this out the
> door before Commodore releases the computer we should have had,

Well, the Amiga was designed by people who thought it took Atari too
long to design a 16-bit computer.. it's their own fault they then took
even longer. :)

> but lost
> because I wanted to sqeeze the last drops out of Amiga coporation... Doh!

This happened after the ST was released. We're talking STe by then, but
that didn't have just a PSG. :)

> Don't get me wrong, I like and own (several) STs, but when the C64 is being
> bashed I need to counter... :)

Comparing the C64 to 16-bitters is of course silly, but as 8-bitters go
I still don't like the C64. :)

Commodore itself should get even less credit btw.. the VC20 and C64 were
designed by Jack Tramiel, the Amiga was designed by ex-atarians..
(there's this Atari-line running along all better Commodore products..) ;)

Look at what they did without Ataris help, like the C16 (which was a C64
with all its selling points removed), the Plus-4 and the PET (the only
computer that could blow itself up softwarematically. Heh.).

Oh yes and not forgetting the disk drives and printers. Muahahah. :)

Maurits.

Saleswise, the Amiga didn't blow the Atari off the planet at all. And
this was probably due to it's crappy slow OS and of course MIDI helped
Atari a lot.

Maurits.

Took Atari too long? Jay Minor left Atari before they even considered
designing any 16-bit hardware...

> > but lost
> > because I wanted to sqeeze the last drops out of Amiga coporation...
Doh!
>
> This happened after the ST was released. We're talking STe by then, but

So the STe was around in 1984? I don't think so... It took atari 4 years to
realize, hey we need to match the Amiga! By 1989 no one cared that the ST
had a 4096 colour palette, or had a 4 channel DMA chip. The userbase was
stuck with the old ST.

> Commodore itself should get even less credit btw.. the VC20 and C64 were

> (there's this Atari-line running along all better Commodore products..) ;)

Jack Tramiel designed nothing, he was management... Bob Yannes designed the
VIC-20 and the SID. Makes it more ironic you love what is essentially a
Commodore product then... The ST was designed by Commodore engineers who
left Commodore after Jack asked them to join him at Atari...

> Look at what they did without Ataris help, like the C16 (which was a C64

U need TAR archiver. Usage is "tar.ttp xvf filename". Also there is a shell for TAR, neamed TARIT. Should be reachable on our pages (http://yescrew.atari.org) but server is atm down, since it had some issues. TAR u can get on FTPs (ftp.chapelie.rma.ac.be).. Prpbably u can get TARIT on ftp sites as well...

Janez.

PS. if file is named tar.gz or .tgz, u need to ungzipe it before untaring. If u use MiNT or some unix CLI, just add z to tar comand ("tar zxvf filename")

Things like the shifter have a CS pin which I assume is Chip Select, the MMU
and Shifter have DE which I think would be output enable, the circuit isn't
that clear on pin numbers etc. At a first glance it doesn't look like
address lines are used as chip selects though ive not looked at them much
yet, I guess its time for some track current and a flylead and start
shorting pins out to see what does what ;-) no doubt will all lead to bombs
:P

Well, be sure SCSI cahin is properly connected and terminated with no ID clashes.
Then get a suitable driver (SCSITools, ICDTools, AHDI, HDD driver) and then format and partition the disk. Be sure not to make bootable partition (C:) not larger than 32 Mb.
2.5" IDE disk fits nicely into Falcon, too. Procedure is similar.

:)

> that some of the hard work involved is already done?

1. Source code of earlier Mozilla versions is not avialible.

2. You do not know some basic facts about Mozilla, let me explain:

Mozilla is a project that aims to create some software. One of main products of that project is Gecko - a page rendering engine.

There are at least few projects that use Gecko. There is Mozilla Browser - it uses Gecko. There is Mozilla Firebird (a liteweight browser) that alsu uses Gecko, there is Galeon (webbrowser for Gnome) that also uses Gecko.

Gecko is very powerfull. In fact Gecko port for out platform would be a bliss, GEM interface to it could be done quite easily, but porting of it is not an easy task.

Well yes. Magic relies on developers if they will choose to port it and
do some work to port it. But it still more work as MiNT, which will be
ported if there is one user, if he is enthusiastic enough to compile it, he
he. MiNT is also free, so it will prolly be choosed by hardware designers
as well, for testing reasons and also to develop a working machine with OS
etc... they also can modify sources themselves etc to make it run on new
hardware etc..

> Yes and no... MagiC indeed is a little friendlier on smaller systems, but

> to keep an eye on available memory?

Well u can boot Magic with Magxdesk and few essential acc's and cpx-es.
Booting MiNT with Unix and AES/GUI takes a lot more, even if not using a
lot of 3rd party stuff.. XaAES/Teradesk use less as NAES/Thing, but imho
atm they are far from maturity. But they change and improve almost daily,
so maybe some day....Ofcourse i think MiNT with AES and Unix is a way to
go. Without Unix its similar to Magic (except loadable devices, filesystem
drivers like ext2..) so very debatable what to use....

> Also, I know it's human nature --- why do people always try to port over
> the very last (bloated) version?

Little miracle, i actualy agree :)

> Take the Mozilla browser for example, the

> a lot of people. They've been ported for Mac 68xxx based computers, so I

> presume that some of the hard work involved is already done?

Hm not really. Porting as we mean is compiling source code and hoping to run on our system :) No, seriously, porting let say knews (nice news reader) means we compile it under mint with gcc. Then u run it, but u need to have Xgem server active, or Xwindows up. Those arent as fast as GEM so even if its totaly usable in ct2, it behave like some GEM app on plain Falcon. To use it as Mac did, application would need to be translated, which means that apart from compiling, we need to replace every Xwindows GUI function, let say to open window, to GEM/AES functions... thats quite a lot of work.

Better choice is as Adam already said to port only Gecko, which is rendering engine for HTML code, and add GEM GUI on top of it.. That would be faster, more to our taste and also allows cut/copy, drag'n'drop etc services will work flawlessly... Lack of those with Xapps in GEM (via Xgem) is imho a problem. But Mozilla sources are not available...

> between programming and porting right? ;-)

Of course there is difference. I just understand post diferently. But i agree here, big majority of apps, written cleanly and after GEM coding guidelines, will work on all OSes. I wouldnt say most programmers support either MiNT or Magic tho, just OSes are that damn good. And if some tweaking is needed, usualy programmers also made them if needed to make app work on all OSes. Situation in this respect is quite good on Atari, imho...

Janez

P.S lets stop arguing what Magic/MiNT has or havent. In MiNT missing stuff may happn, or may not, on Magic it prolly wont. But if its possible, well add that part of code...

I can now say with confidence that the Falcon is entirely stable in
030 mode. With just XControl (patched) and NVDI 5.03 the system
regularly crashes. I don't have a great idea of what's doing it yet
-- for instance, using the colors CPX to change color #1 (default =
white) will usually crash it in 256 color mode, but not in 16 color
mode. I haven't tried disabling all but the CT60Conf CPX yet, so
that's next to try.

MIDI was the one area in which the Atari ST was truly successful and I believe is really the *ONLY* area Atari can succeed in again!

What I envision is an all-in-one, integrated MIDI computer, in a laptop form factor. Plug it in and turn it on! It's ready to go in seconds! Plug in a USB keyboard/controller or a standard MIDI keyboard/controller... No extra software to buy. Bump it, swing it... no hard drive to worry about crashing. Near instantaneous boot up. Responsive UI. Rugged chassis. Musical nature. And... made by Atari!

If anyone considers this idea a worthwhile topic of discussion, please reply here.

Luposian

While they're at it....
They should make a totally wireless (not counting the AC source) mixing console,
snake head, and amplification system that'll fit in something about the size of
a foot locker while sounding really wonderful and powerful ;)

Okay, even if they do a step inbetween that multiplexes over coax or fiber
instead of those gawd awful 400 lbd analouge snakes with the 65 lbd steel reel
to keep it sorta organized.

This is so doable, yet all the pro audio companies keep cranking out heavy,
bulky, power hungry stuff that's mostly plywood, steel, and WIRE.
Grrrrrrrrrrrrrr........takes a bloody 5 ton truck to get to the gig!

Brian

I have the bag, I have no opened it, there is a cable and 1 normal 1/4 watt
resistor.

Carey,

I agree that your over 20 line signature is excessive and in fact interferes with some of the searches I've done. A search for "CT60" for instance, will bring up every post you've ever made on any topic since it is in your signature line.

I am quite interested in your Atari equipment, since I have quite a bit of similar stuff, and knowing what you have working together is of interest to me. However, it would be helpful to me personally if you would minimize your signature file. A link to a website detailing your equipment would be most welcomed.

I hope you do not take offense to this post, for it is intended to suggest, not insult.

>
Switching to an IDE drive proved relatively painless for me. I'm
using a 2.5" 3.2Gb. Note that 1Gb partitions are a natural limit of
TOS 4. Also note that you may have to fabricate or purchase a
mounting bracket if you don't have one inside already.

SCSI should be just as easy if you already have a working SCSI chain.
Just swap drives and keep the ID number the same.

Unfortunately, there are both IDE and SCSI drives that for weird
reasons won't work on a Falcon. I don't know if anyone has an up to
date list.

One more thing. There is no requirement that the bootable
partition(s) be limited in size using HDDriver. I do not know if this
is true for other boot loaders.

Hmmm both Falcons, all 5 ST's, all 5 8-bits, Jaguar, Lynx, Portfolio, 2600 and my MegaSTE boot fine, and I am picking up a TT this weekend. Can't wait, the excitement is killing me. Can't be that dead.

For some, I bought NVDI 5 recently and love it, I have also bought as much stuff as I can get here in Melbourne. Even got some stuff from16/32 sent from the UK, cost a packet adter the exchange rate. But I love the anticipation. I will load the latest Terradesk soon to check out.

I think the CT60 is pushing the limits of what the Falcon can do. I
also am convinced of Rodolphe's ability as a hardware designer.

My CT60 does not yet work reliably, and I've posted a bit here trying
to pin down the problem. The truth is, troubleshooting is rather
frustrating, but I strongly suspect the problem is not with the board.
There's much more to check before I send the board back to be checked
by Rodolphe and even more to do before I give up, so until I get it
working you will see these posts that indicate all is not well.

There's clearly something wrong with my CT60 - Falcon setup though.

Clockmeister <no-one@nowhere.com> writes
>
>The Amiga blew the ST off the planet, superior technology again plus it was
>applied intelligently.

My Amiga crashed all the time.

>Anyway SID vs YM... SID is a clear winner.

True.

Anyway, why not stack this up.

Amiga 1000
Atari 520 ST

Amiga 500
Atari 520STFM

Amiga 2000
Atari MegaST/2/4

Amiga CDTV

Amiga 600
Atari 520STE/1040STE (though, the STE predated the 600, and should be
compared to 500plus)

Amiga 3000
Atari TT

Amiga 1200
Atari Falcon

Amiga 4000

Amiga CD32
Atari Jaguar?

How did the lines evolve? Atari kept dropping good ideas, like the
Falcon Microbox, but they still sold plenty of machines. What's an A1200
worth now, ï¿½15 or something? Falcons go for ï¿½250 or more. Not only that,
but an A1200 is still a fairly pointless device to have in stock form,
whereas a Falcon is useful for music applications right out of the box.

The STE may not quite kick Amiga arse, but it was a worthwhile update, used SIMMs for expansion, and is very compatible with previous models.

The Amiga has no real comparison to the MegaSTE. Maybe an ECS A2000.

The Atari TT lacked the graphics of the A3000, but it had the stability the A3000 lacked.

All of the Ataris are useful for music as stock machines. Amigas are pretty useless except for games without any additional hardware.

Not that Amigas suck. It's just a case of different machines for different purposes. If you want to do serious stuff, get a Mac - that's what I did, I replaced my 1040STFM with a Mac IIx in 1989 :P

(And an Archimedes A3000, but we can't be right all of the time).

> distinct all the time. ;-)

Sure it is not. Actualy that is not necesarilly a bad thing. After all Magic, MiNT, TOS, Geneva or XXX should be different, or it would be damn boring... MiNT lacks some of Magic features, Magic lack some of MiNT/AES things... But those things realy dont affect us much. Try DOS/Windoze/OS2 apps and we all know how portable they are, or just MacOS7--8-9-X apps. Even on preX OSes, which is unix based and has excuse for portability probs, things were worse as on Atari with DIFFERENT OSes. Truth is, Magic did differentiate from AES, which is not a good thing, but so it is, it wont change, so it up to us to overcome that, with wdialog/ndialog type of stuff, or internal code. Still those are really tiny probs, compared to stuff on other machines with only OS upgrade. It is a bit silly that we hate each other if magic cant use toolbars, or N.AES display icons in wrong color... Imho

>> You should have got an Amiga... it had a wow factor that the ST sadly did
>> not have.

Well i have bought Amiga as well, so i could enjoy iy as well, altough im Atari fan. And 1200 i got realy had a WOW factor. WOW this OS is so fucking slow. Nice demo/gaming hardware, some nice solutions, but OS basicaly useless. Amiga is machine with the MOST accelerators created, and thats not because machine is fast, thats because machine is slow. Ataris with 1 or 4mb, falcons or ST are to this day still used in studios, and they are unmodified. And many of those studios are big ones... They are used less and less novadays, but it needed 15 and machines to exceed 1ghz to start replacing them... Demo scener may not say wow, lame one, others will cheerish good product on any machine, being ST or Amiga or VIC20! Midi user will say WOW to ST... There is no bad and better machines, its all in heads, and many seems to be quite empty here.

>SpareMiNT (mantained, but not easy to install)
>
>EasyMiNT (mantained, in fat it is SpareMINT with some extras that make it
>much easier to install).

You've overlooked one, but then it's a version where no one can be proud
of, in fact it's best not mentioned at all: MacMiNT, Janez will probably
come forward now and correct me, but this is the biggest crap you've ever
seen, the guy that ported it must have been very sick that day.
The problem with internet is that crap like this is available for download
as long as its hosted somwhere, this version doesn't do any justice at all
to MiNT, it should be removed and trashed.

>If you are a newbie, stick to EasyMiNT.
>
>Steve, please stop this false propaganda.

Euh... from where I am sitting, it looks like Steve is *replying* to false
propaganda. Nothing really ever changes in here... someone feels the need
to declare MagiC and all its users dead, and then these "living dead" of
course come forward... and before you know it we have a new OS-War on our
hands, and it usally ends with MiNT-users feeling abused.

Cheers from Belgium

Hi Adam,

>1. Noone never called MagicNet a hack. In fact lots of people were really
>amazed by this.

Small correction, last summer a dedicated GFA basic programmer referred
not once, not twice but several times to MagiCNet as a "third party hack"
here. And since that programmer happens to be an authority on everything
related to MagiC and networking, I assume it's true.

>2. MiNTNet is just a kernel module for FreeMiNT. It is a module becose
>not everone needs it, and the philosophy behind it is: do not waste
>memory if not needed. So if you do not need it you can save those few kbs
>of memory.

That's what I said; without it MiNT has the same networking abilities as
TOS and MagiC => none.

Cheers from Belgium

>Therefore it IS the future. If free and open fails, it is probably the
>time to decide that our platform is truly dead. Time to put our computers
>in the closet and wait for 20-30 years until they are worth serious money.

If for some reason tomorrow the whole platform would collapse, so what? The
apps we've got are still here. The apps that made this platform what it is.
New software, updates, upgrades & bug fixes are nice and sometimes fun but
do we really need them? What's the difference between i.e. Calamus 2002 and
2003? If Invers would decide to stop supporting this platform, does this
then mean that Calamus all of a sudden is unusable? I think not.
And here's something to get worked up about: Open and free *is* failing on
this platform, in order to be a success the majority of users need to run it,
and that only happens in dreams of some dreamers here. One needs more then an
open OS, one needs software also, and it is in that department that things
don't seem to work out to well...

>I loved your 95% figure that you pulled from your posterior earlier. If I
>had to call it I'd say it's more like 5% of developers develop
>specifically for MagiC,

Read the post I replied to again, the poster wanted to know if MagiC was
still supported, I think that the 95% is spot on. We are not talking about
MagiC-only or MagiC specific support here.

>if even, and more like 95% of developers remaining develop for our
>charming GEM environment, and really care if things run on MagiC AND MiNT
>alike.

Exactly, and that's how it should be in the first place. There's no reason
why a decent programmed app shouldn't run perfectly under both OS's. But in
my experience, most of the programmers I ever had contact with put MagiC
compatibility higher on their priority list.

>In my world, Atari users want to compete with the flexibility and
>power that current pc offerings have. They don't only want nostalgia,

Well that's in your world :-)
In my world however, Atari users don't give a damn about PC's, and they
certainly don't use it for nostalgic reasons either.

>they want functionality on an alternative computing platform and are
>willing to pay for it.

Sorry but I don't agree... look at the facts, they're right there under your nose. If these people who wanted functionality and were willing to pay for it, really ment it, then both the Hades and Milan would both have been selling like hot cakes. The vapourware XTOS machine would have enough pre-orders to warrant at least building a batch of developers boards...
And if you think these figures are extreme, well let's take some more down to earth examples: How many people have a setup with a graphic card? How many people have +14MB machines? etc...
The facts are simple: yes, people want functionality, but they're *not* willing to pay for it (except for a small minority) on this platform. They never were, it's one of the reasons why Atari didn't survive in the first place. Over the years some people have created wonderful and amazing upgrades, they're all gone, leaving the developers behind with a financial horror story.
You realise I hope that there's nothing new under the sun? Back in 1989 one could already buy a 68040 upgrade for a MegaST, ethernet cards have always been for sale, same thing for graphic cards, ram upgrades etc... but at the time when they were developed, no one was interested in these. Don't put your computers in a closet for 30 years - they'll be worth shit - but put all those nice expansions, upgrades and goodies is a safe for 30 years, these will be worth a lot...

>150 people who bought the CT60 can't be completely insane.

No of course not, but what percentage of Falcon users do these 150 people represent? 5%, 10% at most ?

>You don't increase the power of your system 10-fold because you want the
>same features.

Exactly, and its in that department that things stink. I'm a 68060 user for a couple of years now, well, until today, "all" I've got are those same features and of course more power. Do you honestly think that those 150 new 68060 owners will change anything to the situation? 1500 Hades and Milan users weren't enough to change anything to the catch22 situation.

>It requires working against what sometimes seems to be impossible odds.
>But most people left are really up to it... They really really are.

I've spoken my peace last summer... and six months later on, no one has proven me wrong. Stop telling us how capable you all are and up to the job, but PROOF it. Stop dreaming up dreams for other dreamers and face the facts.

>So yeah, maybe teradesk and xaaes are a bit like children in their
>development cycles. They have a lot of growing up to do. But the fact
>remains that they will grow.

Bla bla bla.... I've heard this at least a hundred times before. There's a flaw in your argument.... suppose that tomorrow the code of i.e Timeworks Desktop publisher would be open and free to use, then I suppose you'll come here telling us how great it is and to dump Calamus? Well, that's exactly what you're doing right now with Teradesk... I don't give a toss how and into what it may grow, at this very moment, it's a very poor excuse for a

desktop, certainly compared to Thing and Jinnee.
We've always had excellent desktops on this platform, remember Neodesk and Ease for example? A new comer even if it's free need to be at least every bit as good, right now Thing and Jinnee are the ones to match, and they've both were created by individuals in their spare time as well.
Oh.... and search as much as you like, but I never written one negative comment about xaaes, MiNT deserves a better AES, it will be welcomed by many but who on earth is waiting for teradesk?

>And there will be no more locked up source. No more walls. No more
>developers disappearing or greedily locking their code in a vault for no
>good reason.

But that's not enough.... and you know it. Writing code is not easy, if it was all computer users would write their own code and OS. IMO knowledge and talent plays a big role. And that's what you pay for... most of those greedy developers that left the platform, had more talent and knowledge in their little toe then some of the open source maintainers in their whole body. An yep, I know you don't agree... but then I''m not a dreamer but quite down to earth.

>And you'll be left with not much to say. Maybe you'll mutter some stuff
>under your breath about how it all can't run on 4 megs of ram,

I've got 256Mb in the TT, you'll have to come up with a very special app before you here me mumbling between my teeth.
That 4Mb issue should have been resolved years ago really, Atari officially stopped supporting the ST-line when the Falcon was released. Eleven years later it's still an issue... programmers should have stopped supporting the ST also, it would have been at least an incentive for some people to upgrade to a TT or Falcon and later on perhaps a clone...

>meanwhile current pc's will cross the 2GB barrier for beginning line.

So what? Their bloated OS (Windows and Linux alike) will garble up 1GB easily soon also, PC users will always have memory issues. BTW: this is an Atari group, what all all those braindead and/or brainwashed users on other platforms do or don't do is off topic here and not relevant either.

>Just remember, MiNT isn't perfect and nobody is claiming that it is. But
>man people sure do love to open up presents, they love to download new
>software and they love to see a system evolve before their eyes. It's
>just nice, that's why people will use teradesk even if there are better
>offerings currently.

No... there's a difference between "taking a look at" and actually using an app. No doubt people will look at teradesk from time to time, but I doubt that many people will ditch Thing or Jinnee and actually *use* teradesk.
I'll phrase it differently: at the moment teradesk doesn't do MiNT and/or MagiC any justice, it might one day, but until then like I said, I prefer working with something that is "dead".
Let me phrase that differently also: whenever a new release of Highwire is announced, I download it, take a look at it, and say to myself "nice try".

But that's it, Highwire is not on par (yet) with the standard Atari browser (CAB). And that's how I compare software, I don't give a toss if something is free or commercial, what is important are the features, and IMO as long as an app doesn't match these point by point then there's no point in talking about it either.

>Anyway, I'm so rambling and I have nothing left to say to you.

Right, not to mention that it was completely off topic as well.

>You've lost credibility in my mind a long time ago. Really I'm just bored
>so I'm saying this for the benefit of everyone.

You could just as well have kept your trap shut, you didn't tell us anything new, but then I didn't expect that either... the surprises and nice stuff usally comes from the other corner, the silent one...

> Have a good year

I've stopped counting them....

Hi Adam,

>General usenet netiquette rule is that signature should not be longer then
>four lines, and should start with "-- " so news programs may cut it
>automagically when responding. Not following this rules may be considered
>"rude".

It's a pity that there aren't any rules about the length of the headers, some posters their headers are larger then Carey his signature... Carey his sig. occupies 23 lines (694 bytes), I've seen some headers here that are far more worser. So before flaming Carey for his large signature, some people would better take a look first to the header their favourite newsreader produces, headers take up bandwidth also....

Cheers from Belgium

>

Yes, sort of. I'm building a media PC to handle video recording and do
MP3 playback through my stereo. If the TT could handle the job I'd
gladly use one, and probably spend much less on the project. Part of
me wishes I still had one of my old TT's, but I don't have the heart
to dismember a living TT for this. So I was hoping somebody might have
a dead one and I could just use the case. I'm also considering one of
the SFF cases (since I'm planning to use a mini ITX board) but I'd
rather use an Atari case.

MacMiNT is a diffrent case. When I say: "KEMD, KGMD, MiNTOS, SpareMiNT, EasyMiNT" that are diffrent software distributions based on the same kernel. On the other hand MacMiNT is a fork of a kernel (a diffrent version of kernel).

Point one false statement in that thread that has been issued against Magic. I can point at least two agaist MiNT.

But headers are easy to switch off (not bandwith wise, of course) and
virtualy any reader does that. Signatures, however, without delimiter
cant, so headers are not so annoying. Headers also are used for mail/news
transport and tracking them.. Signatures not exactly as important......

Nothing to correct here about MacMiNT. It was try to port MiNT to Mac, was left in very early stage and virtualy not usefull. But i do find stupid to drag relicts like that, ported to other platform here.. I had try one of earliest MagicPCs and they werent any good as well, thats for me irelevant. Any programm, decent or not, has some history, but i dont see why thats of any importance... There are 2 major MiNT distributions, and there is one Magic distribution. There are MiNT kernels for 040, 060, Milan bla bla, and Magic patches for those CPUs. So what? More or less previous versions, or patches or distributions make one OS at current time bad or better?

> Euh... from where I am sitting, it looks like Steve is *replying* to false

Rodolphe,

I think its working a lot better now, I had 220R resistors not 33R! But I couldn't find 33R so I have used 22R, not much off ? I also replaced the inductor with one off a old STFM board. I have managed to play a MP3 about 5 times so far, before it crashed after just a few seconds. Hopefully this was the cause of the disfunctions, I will test out with more programs now.... maybe finnally I can register ANIplayer *looks at Didier* ;-)

Thanks!

Chris

> body. An yep, I know you don't agree... but then I''m not a dreamer but
> quite down to earth.

So what? They left us. I dont give a shit, if someone is as talented and mighty as god himself, if he left the platform. Take Magic for example. Noone question its developers capability and talent, but who benefit last few years from that? Mac users. Users like me, Atari users, are stranded. Period. All this pointless arguing what Magic lacks, bla bla, wont take place if someone would still work on Magic. U may ditch open source maintainers as u wish, fact is they do their job from love to platform, not for money. They also have mouth to feed, fauvorite greedy programers argument, but they still remains on platform doing stuff. And things like MiNT, Ace, Highwire and so on, can be compared to ANY product from comercial scene, talent and hard work wise. And some of us (us, as im not best arround) make worse prods, so what, noone force anyone to use the products, and/or to pay for them... WTF we need then to listen this crap? Who worship those greedy talented developers, should change to MAC/PC where they now spread their talent and support them further, and leave us in peace.. I code purely for my joy and hobby.... and get attacked if im not bonded with commercial restraints. What many ppl dont understand is that so called non talented coders actualy make core of app/etc very well, just not forced to make some nifty GUI arround, since thats commercial requirement to sell stuff... Or demo coders, most talented of all, just realy hooby coders, code out of love to platform and scene, not money, thus even ST scene is strong and prods are awesome... not usefull for comercial users, i agree, but VERY talented!! And on meetings or o net, we dont argue bout crapy stuff, thats mainly and exclusively domain of users...

So guys, get on with spreading Atari feeling, what M$, Tramiels of whoever didnt succed, u will....

Hi all,

After much caos I finallyl get to boot my CT60! here of the results so far
made with nembench......

NemBench v2.1 - precision CPU/FPU profiler.

Integer multiply (16bit) -> 34.133 Mips (~5568%)
Integer divide (16bit) -> 3.029 Mips (~836%)
Linear (stalled) integer -> 66.601 Mips (~836%)
Interleaved (piped) integer -> 132.129 Mips (~1659%)

Float multiply (64bit) -> 22.755 MegaFlops (~8586%)
Float divide (64bit) -> 1.828 MegaFlops (~1056%)
Linear (stalled) float -> 34.133 MegaFlops (~6403%)
Interleaved (piped) float -> 34.133 MegaFlops (~6416%)

16bit read (100% hit) -> 131.578 MByte/sec (~1675%)
16bit write (100% hit) -> 128.205 MByte/sec (~2131%)
32bit read (100% hit) -> 263.157 MByte/sec (~1676%)
32bit write (100% hit) -> 263.157 MByte/sec (~3947%)

Linear 32bit read (ST-Ram) -> 5.247 MByte/sec (~98%)
Linear 32bit write (ST-Ram) -> 6.949 MByte/sec (~107%)
Linear 32bit copy (ST-Ram) -> 3.065 MByte/sec (~94%)

Linear 32bit read (FastRAM) -> 69.350 MByte/sec (~1304%)
Linear 32bit write (FastRAM) -> 68.444 MByte/sec (~1061%)
Linear 32bit copy (FastRAM) -> 27.193 MByte/sec (~842%)

Linear burst copy (ST-Ram) -> 2.944 MByte/sec (~91%)
Linear burst copy (FastRAM) -> 33.608 MByte/sec (~1041%)
Linear burst copy (ST->Fast) -> 4.912 MByte/sec (~152%)
Linear burst copy (Fast->ST) -> 5.917 MByte/sec (~183%)

Looks fast to me!

Has anyone tried running "Lazers and Zombies" ? I can't get it to run under
CT60 mode, I get a register dump on screen ? Rodolphe ?

By the way, I have a copy of Geneva somewhere, does anyonek now if its any
good and more to the point run correct under CT60 ?

Cheers,
Chris

That's because there are many more A1200's out there, but the many upgrades
are more expensive ('060/PPC/PCI/USB etc)

Most of these upgrades are not available for any Atari.

Not only that,
> but an A1200 is still a fairly pointless device to have in stock form,
> whereas a Falcon is useful for music applications right out of the box.

What a rediculous comment.

> The STE may not quite kick Amiga arse, but it was a worthwhile update,
> used SIMMs for expansion, and is very compatible with previous models.

If offered nothing substantial. It was like the A600 upgrade from A500, two
steps forward and one step back.

> The Amiga has no real comparison to the MegaSTE. Maybe an ECS A2000.
>
> The Atari TT lacked the graphics of the A3000, but it had the stability
> the A3000 lacked.

The A3000 was plenty stable. I ran OS2.x for many years and it was very
stable compared to any other OS's at the time.

> All of the Ataris are useful for music as stock machines. Amigas are
> pretty useless except for games without any additional hardware.

Only if MIDI is your thing otherwise it is completely useless. Tracking and
sampling and music reproduction was handled very well by Paula over the
years.

As a video production tool the Amiga's ability in this area are
unquestionable.
> Not that Amigas suck. It's just a case of different machines for
> different purposes. If you want to do serious stuff, get a Mac - that's
> what I did, I replaced my 1040STFM with a Mac IIx in 1989 :P

The Mac offered very little to the creative mind in those days, unlike the
Amiga. For stuffy office apps a PC was the best solution.

> (And an Archimedes A3000, but we can't be right all of the time).

LOL

Had one of those too, for a few weeks. It wasn't a bad machine but little
software for it and I had been spoiled by the Amiga ;-)

It's irrelevant today as it was then, but people will still bite.

Ofcourse it is a case of horses for courses, and for what I wanted out of a
computer the Amiga was the best solution...

He never owned Atari and Commodore at the same time. He didn't even own
Commodore in the 80's! He was simply the president and founder, but in the
1960's Irving Gould bought the controlling shares of Commodore. Commodore
crashed and burned because of Irving Gould, not Jack Tramiel... He did that
with Atari... :)

556. Help... STZip 2.6 deflate speed?

Newsgroup: comp.sys.atari.st
Date: 2004-01-21 23:26:20 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <400f0a741527b650@tripnet.se>
Source record: 21494

I did something stupid...

Started compression (deflate) with STZip 2.6 on a 530 MB file. The zip-archive is written to a partition with long filenames and I don't want to interrupt the process and get lost clusters on that partition.

I did this about 24 hours ago and it is still working quite happily (thanks to multitasking).

Has anyone benchmarked the deflate process on a TT in TT RAM? It would be nice to do a approx. calculation of how long it will take until it is finished :-)

I suppose the time is proportional to file length so just a couple of MB's would be enough for a rough estimate?

And yes, I have tried the ESC button but it will not abort as there is only one very long file...

557. Strange harddisk problem

Newsgroup: comp.sys.atari.st
Date: 2004-01-22 00:01:54 UTC
From: Kenneth Medin <kennethm@tripnet.se>
Message-ID: <400f0a741527b651@tripnet.se>
Source record: 21346

I've put together an external HD for a friends TT and it has worked perfectly for almost a year. Now he powered the TT off for a week and when he came back and turned it on again and it will not boot.

HDDriver crasches(?) and all you see is the internal drive line OK followed by the external with random characters in the first part of the device name and freeze...

I took the drive and cable over to my TT and everything is perfect. Did a complete backup of the drive to CD (file by file to ISO) and no read errors detected.

Took the drive back to him tonight and it still shows the same error on his TT. We both use HDDriver 8.03 (guess I should upgrade...).

I disabled the external drive in HDDRUTIL.APP and then it will boot and run errorfree from the internal drive. The "Device check" however also displays the random characters in approx. the first 16 positions of the device name.

Both TT's have there internal resistor packs removed. The external drive is a Quantum Empire 2100LS (reqires initiator identification) and my friend has another Quantum 270 MB internal drive.

My configuration is:

HDDRUTIL 8.03 Gerï¿½te-Check:

```
Bus 0: Atari ACSI
Bus 1: Atari SCSI
00.00: FUJITSU M1606S-512 6406 Direct Access
01.00: HP C3725S 6039 Direct Access
03.00: QUANTUM LPS270S 590H Direct Access
04.00: RICOH CD-R/RW MP7040S 1.40 CD-ROM/CD-Recorder/DVD
05.00: QUANTUM FIREBALL SE6.4S PJ0A Direct Access
07.00: ATARI TT HDDRIVER 0803 Processor
```

But only the internal 00.00 Fujitsu was active together with the 2100LS.

I can't think of anything except internal bad contact (chips and/or connectors) in his TT or failing hardware...

Anyone with a similair experience or ideas what made the HD stop working on my friends TT?

FaceValue is actually quite good for making quick GFA programs with
pretty looking windows and dialogs with very little or no knowledge about
GEM programming.

And you don't have to write THEN all the time... :-)

Since the Device check shows a scramble even with the drive disabled,
I'd suspect a scrambled HDDriver file. Have you tried removing
HDDriver and reinstalling it?

Tested this this evening. With only XControl (CT60 version), WDialog
1.98, CT60Temp.acc, and NVDI 5.03 I had undesired reboots under
1stGraph and Aniplayer 2.20. The machine does work, but I never know
what is going to make it reboot.

The motherboard has about a dozen small "coin"-type capacitors
soldered to it. I rather doubt that Atari did this -- might it be
some form of strange "upgrade"?

> if I pass this fpu test my gcc problems could disappear.
>
I downloaded your FPUTEST software. On my 030+881 Falcon (stock,
except for the FPU chip), the BENCH program is done in a little over 8
seconds. On the CT60 Falcon sitting next to it, the BENCH program is
done in about 11.7 seconds. Curious that the CT60 is slower!

However, the FPUTEST software works! As I type this, my CT60 has
passed 94,400 cycles without an error. I don't know why your CT60
isn't working with FPUTEST, but mine works.

On the other hand, I'm still getting undesired crashes and reboots.

That's interesting -- I wonder why my CT60 is so much slower than
yours?
I'm using a 66.6MHz clock.

> By the way, I have a copy of Geneva somewhere, does anyonek now if its any
> good and more to the point run correct under CT60 ?

It does, and I'm not getting any more crashes with Geneva than
without. The Nembench numbers with Geneva running are identical,
except ST-RAM functions about 25% faster thanks to Dan Wilga rewriting
that part of TOS. NeoDesk4 has issues with 256 color mode though on
my Falcon, and I'm not sure why.

You can rightfully say a lot of bad things about TOS 1.00 but it was definitely not unstable.

And TOS + MiNT rules (as long as you don't use it as Atari corp. provided it) ;)

Maurits.

>The Mac offered very little to the creative mind in those days, unlike the
>Amiga. For stuffy office apps a PC was the best solution.

Bollocks. The Mac offered considerably more, in the form of the Mac IIx.
And before you say "You didn't try an Amiga", I 'replaced' the Mac IIx
with an Amiga 1200 system, fully loaded, even with Commodore's
overpriced multisync monitor.

Amiga Workbench is unintuitive and unreliable. About the best thing the
Amiga could do was run Frontier.

My IIx had 24-bit colour, music and graphics packages.

Hell, I'd argue that an Apple IIgs was better than an Amiga in many
cases.

That's no longer true. The socket handling is now an integral part of the
kernel and managed like every other filedeskriptor. As effect the socket
interface is now offical part of the system call interface.

Just the inet4 routines are still an external module for people who want
to save some memory.

EasyMiNT is just an GEM installer for Sparemint. Nothing more, nothing
less.

Sparemint is a collection of software packages for ATARIs running
FreeMiNT. The package system is based on the rpm package manager (as also
used by several Linux distributions).

OK, got the answer myself now... It took 27.5 hours and the file was in
fact 541.5 MB long. I did a lot of other things in he meantime on the TT
so perhaps an hour or so less if idle. Transfering to the pc now to check
if it's readable without errors...

>the best? Highwire looks pretty interesting.

MagicNet and MintNet both need multitasking and will not run under plain
TOS. STinG runs well with all.

STinG is said to be slower than the others but it's fast enough for me.
Everything (except ROUTE.TAB routing table) can be configured using cpx
modules and you don't have to reboot for changes to take effect.

STinG handles multiple networks in subnets fine. Good if you want to
experiment with MIDI or nullmodem SLIP connections from your TT to other
ST's etc. I have upto 8 Ataris online here on various subnets, al running
STinG.

Does STiK have Ethernet support at all? Guess it's intended for a simple
dialup connection only.

MagicNet and MintNet can use most STinG clients but not the opposite.

Clients I'm using:

Newswatch for news and Popwatch for mail. Both need a separate reader. I
use Okami which overall _is_ the best. Can be hard to setup mainly
because the doc's are not updated. Not for the average OE (like you?)
user... Does not look so nice but have lots of features and is very
stable as long as you stay out of known bugs. I prefer Okami to both OE6
and Mozilla 1.5.

Mymail is a very good mailreader/client and if/when it will support news
I might think of switching from Okami. And it Swedish made and therefor
of good quality :-)

Newsie for less "advanced" mail and news. Lacks support for international
characters like ï¿½ï¿½ï¿½ï¿½. Can be used alone or with Newswatch/Popwatch for
the online part.

Aicq is a good ICQ client.

FTPSERV ftp server.

Aftp nice ftp client but a bit buggy sometimes under STinG.

Telstar telnet client.

Weblight webserver. with some Perl support.

Bnet networks drives. Sort of usable but tend to fail if you copy
directories over the network here. Might be my setup, though??

MEG spamfilter with static filters but very usable. Hangs sometimes on
strangely formatted spam mail. I get 125 spams per day with lots of SWEN
virus and appr. 10% slips through the MEG filters and _no_ real mails
have been filtered by misstake. Compare that to the Mozilla filters that
miss about 5% of spam but also tend to block real mail as well.

CAB 2.8 is still the only usable browser. I use it a lot actually but
MSIE and Mozilla are off course much better.

Highwire is _very_ promising but the fact you can't yet fill in forms
makes it useless IMHO. You can't do a simple Google search...

I also use a time client to set the TT clock.

TUR.APP to check open connections in the IP stack.

Resolve, Ping and Traceroute is built into the STinG dialer. Note that
for some reason is STinG traceroute useless behind NAT but simple Ping
works!

Source record: 21363

There seems to be high demand for hard disk hosts for the ST and STe lines. I'd think it just might pay off for someone to do another batch of hosts...maybe with some extras, like USB or Firewire groundwork and some drivers for popular devices.

The trick is to fill a current demand for hosts, while enticing those who already have one to 'upgrade'. USB or Firewire would certianly fit that bill. Prove to me there is a working prototype, and I for one, would pre-order-pay and wait for enough orders to do a production run. This philosophy seems to have worked for CT2B and CT60.

Is it possible to work USB into a hard drive host? I really don't know; however, I do remember a few devices that achieved some pretty amazing things with the ST DMA/SCSI port back in its hey day. There might even be some SCSI to USB devices on the market that might be a good place to start?

Brian

The plot thickens. Although my fpu passes no test, I compile the latest version of lame and mpg123 with -m68020-60 -m68881 and they both seem to work okay. I encoded a wav file on my pc with same version of lame and I can't tell any difference between the two at all. Further after a bunch of work porting the latest mpg123 to mint, compiled with -m68020-60 -m68881 it plays the mp3's just fine too, admitted though they must be resampled first because mpg123 doesn't know about dsp or external clocks.

So either:
A: GCC compiled software detects that the fpu is damaged and virtually unuseable and picks up the slack with it's own software fpu. or.

B: My hardware fpu is okay and some fpu apps are okay and others aren't.. but how?

Interesting even further, earlier my falcon was supremely unstable. Crashing if I just looked at it wrong. I increased the MiNT filesystem cache from 600K to 1024K and it seems fine now. Only change I made that ACTUALLY made a difference, I changed ABE5K to ABE5L and everything else. Nothing seemed to help except that cache setting. I wonder if my basement is just too cold for my falcon. My chip is at 11 degrees C right now and it IS quite cold down here. (The concrete floor is ICE cold).

Thanks,
Mark

If you lurk about on Slashdot, I believe that you will find an
article about a DIY sort of case kit that you can put together
yourself to fit any configuration. It's kind of like Legos for
computer cases.

Some examples included a PC case built into a computer table
and another that was in the shape of a BI-Plane.

Sorry. You are not answering to my suggests.

If, by chance, in your compiled program, the unimplemented instructions
are not present, then you will have no problem with your programs. Your
test on "lame" is uninteresting. I suspect that cosine and sine table
are precomputed. Try to be a little more serious, and consider that my
Eureka program can test all the FPU instructions, and that I use a 060
since near 8 years. I compiled a lot of programs, with a lot of
compilators. I even corrected some FPU bugs in GCC. So, you play a lot,
but it will not make things better for you CT60, and all other CT60
users. I've no time to waste ! I have other things to do ! I can't
spend time with you, if you are just wanting to demonstrate to me
that you have a hardware problem. That's not the case. I told you !!!
So continue to play ... I'm harmless with peoples like you !

CU,

> Some examples included a PC case built into a computer table
> and another that was in the shape of a BI-Plane.

if you go over to the AppleFritter site, they've got a section on a
number of users who recased their Macs using a variety of cases,
including old radios, MegaBlocs and a Shop-Vac! :)

http://www.applefritter.com/hacks/desktops.html

still, why not do a re-case using one of those sleek new PC cases?
Particularly one of those with a window on the side. Not only would that
allow you to have plenty of room for drives, you could even make it
funky by putting in lights. And there would be certainly lots of
air-flow for the motherboard.

I only have two "Ataris" running now. One Milan running MiNT/N.AES, and
one ancient Mac (Performa 475) running MagiCMac. I guess I'm no Atarian
then...

Brilliant Kenneth, OE is just too bloody easy, I set it up about 2-5 times a day and can't be buggered using anything else on the PC. Besides the ONLY good thing it does is handle multiple accounts. I'm a CCNA so I doubt that Okami would be a problem.
Strange that STinG has issues with trace route. Ping is good enough to get started.
Is CAB still being supported? And what about Draconis?

Thanks heaps for your help.

Hi all,

I just installed Magic5, yeah I know, it's time to upgrade my programs, and when I boot up, I get a mono double screen. When I change the resolution to 16 or more colors, 640x480, all I get is a white screen. HELP! please.

Thanks

Richard and anyone else,
Lets face it there are many other things to BITCH
about in this newsgroup other than my SIGNATURE. And
I have posted many times in here with this SIG. And
it is going NO place. You will continue to see my
post in here with this SIG so stop trying to make me
change my SIG. It is not going to happen so give it
up. By the way Richard, there has been many times
where I have posted and my message has been longer
than my SIG.

Thanks,
Carey Christenson

Francois,

Everything you've suggested to me I've tried. You say try eureka, it'll work because it has a good fpu lib and the ct60 has a bad one. Okay? What do I do then? Nothing. All I can do is try to find some tests somewhere to get more evidence as to software or hardware problems. Not all CT60 users have a problem. In fact only 2 do. Why is that? Why does my CT60 have these problems which cause a stability issue and the other one does not have stability issues?

I ran fpu060.prg, I ran it in any combination with fpu__3.prg as I could try. I ran it from the desktop, from the auto folder. First in the auto folder, last in the auto folder. I tested about 3 different fpu progs in any configuration. The ones that didn't cause a total crash right away (any combination of fpu__3.prg and fpu060.prg) just didn't actually change ANYTHING. The calcs were still wrong and still wrong in the same way. I even have beta code to completely disable the fpu on the 060. I cannot get it to work. Either crash, or bad calcs.

I'm not going to sit here and call your knowledge into question but you don't have to belittle/ridicule me. I AM doing what you asked.

Thanks,
Mark

When you use the Milan, you are an Atarian, cause then you use hardware
designed to be a TOS machine. When you use the ancient Mac, you are not an
Atarian, cause it was not designed to be a TOS machine ;-)

Half the fun is missed by tearing off signatures so I turned that
function off.

Here's my new much nicer looking wildcard signature (non for sale!):
--
Atari TT: 4MB RAM, 270MB HD, Genious LAN pocket adaptor in cartridge port,
IBM8513 monitor, Noname trackball.
Atari TT: 4+32MB RAM, 1GB FUJITSU M1606S-512 internal HD, ET4000 Spektrum
graphic card. Extra tower with: HP C3725S 2GB HD, QUANTUM LPS270S 270MB HD,

RICOH CD-R/RW MP7040S, QUANTUM FIREBALL SE6.4S 6.4GB HD, EtherNec, Epson GT-8500 scanner, Samsung Syncmaster152s monitor, Hyundai 15G monitor, Creative speakers.
Atari TT: 4+4MB RAM, 270MB HD, Eizo Flexscan 6500 monitor.
Atari MSTe: MMB RAM, 40MB HD, SM124 monitor, SpectreGCR.
Atari Mega4: Graphics card with Moniterm Viking 1200*960, Megafile60.
Atari Mega2: SM124, Megafile44.
Atari Stacy: 4MB RAM with XtraRAM Deluxe card, 40MB HD, GSM phone with cable for Internet access.
Atari STfm: 4MB RAM+TOS2.06, Atun AM-148 mono and Philips CM8833-II colour monitors switchable, SF-314 external floppy B.
Atari STfm: 1MB RAM, SM124.
Pocket computers etc: Atari Portfolio, Casio PB770 with FA4 and MC cassette recorder, Casio fx602p with FA-2 and FP-10 thermoprinter, Casio Cassiopeia A20, Atari Lynx.
Mac Performa 6200 with monitor, Laserwriter 4/600PS and Midiman MIDI interface.
IBM compatible Pentium533: 512MB RAM, 40GB+80GB HD, CDR + CD/RW, Samtron 76E monitor, Tekram IRMate IRda.
Printers etc: Atari SMM804 matrix, SLM804 laser, SLM605 laser, HP deskjet 960c, Panasonic kxp-1124 matrix, Silver Reed EB60 penplotter, Digital DEClaser 5100, HP laserjet III.
Spare monitors: Atari TTM194, SM124, IBM 8518-2.
Extra peripherals: SupraDrive external HD, Link-97, Syquest 88, Toshiba CDR, Primax scanner, Powerbit Office 56k modem, Alcatel Speedtouch Home ADSL modem, Netgear RT-314 NAT-box, Supra 2400 modem, a couple of handscanners, various spare harddisks, lots of programs in boxes, even more cables to connect most of the stuff together.
MIDI: Kawai K1 keyboard, Roland-U110 module with 4 ROM-cards, MOTU 7s MIDI mixer, Alesis Midiverb II, Alesis Microverb, Casio Digital horn D-H100.
And last but not least: A couple of IBM compatible wrecks...

I've just sketched out a couple simplified rough draft drawings, including preliminary internal parts placements.

Next is to locate parts, design plastics (manufacturer already aquired) and investigate hardware/software developers...

If anyone is interested in this idea, just Email me or reply here...

Luposian

Bombs galore for a single tasker it was rubbish.

Amiga OS blows it clean out of the water, at least any version 2.x or up.

Never have I heard such a complete load of rubbish. Your A1200 was either
broken are you are incapable of clear judgement.

I don't know about the desktopper, but the Wizztronics Falcon Rack is
designed for the falcon, built like a tank, looks great, and allows
for all the ports to be directly accessable from the back (midi and
cart ports require extenders, which cost more!) They used to be real
expensive ($400ish us,) but Steve was selling them at $99.00 clearance
for a bare kit (no extenders.) I got one to recase my CT60 falcon, and
have been very happy with it. I've got a 3.5 ide hd and a CDWR in it,
as well as a new power supply. Plenty of room.
Wayne

One full (not yet opened) can of beer
Casio Quartz DQ-580 alarm clock
3 free mouse balls
Oh! I've just found two more pens!

602. True Paint for sale on ebay

Newsgroup: comp.sys.atari.st
Date: 2004-01-23 11:32:43 UTC
From: jonny_morrisuk@yahoo.co.uk
Message-ID: <f6895097.0401230332.7e5228a5@posting.google.com>
Source record: 21391

Hi there :)

I'm selling my copy of True Paint (HiSoft) on ebay:

http://cgi.ebay.co.uk/ws/eBayISAPI.dll?ViewItem&item=3656760389

I will also be selling a copy of SpeedoGDOS when I have the time to list it. Unless, that is, anyone wants to make me an offer I can't refuse! 10 UKP or more will stop it going on ebay. (Postage about 3 UKP within the UK, probably 4-5 UKP outside the UK, haven't weighed it yet though) :-)

That's UK Pounds. Not Canadian Pounds or US Pounds ;)

Clockmeister <no-one@nowhere.com> writes
>Never have I heard such a complete load of rubbish. Your A1200 was either
>broken are you are incapable of clear judgement.

How can you possibly claim that a 16Mhz, 68030, 68882, professionally
marketed and priced system with standard memory, disks and a huge range
of professional software, plus true 24-bit colour, sound that was
arguably the equal of the Amiga, was in any way inferior to the
crippled, proprietary A1200?

You're completely mad. AmigaOS may have had some good points, but it was
unstable and frankly, weird.

Richard

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

http://www.aracnet.com/~atari/shipping.htm How I can save you Money!
http://www.aracnet.com/~atari/whybuyben.htm Ben's References!

I've got a fast turnaround rate. Usually, Once I receive payment your order goes out the same day. Customers love the speedy service! I have lots of Atari SoftWare & Books. Which I can send by Media Mail Rate!

Please Direct all Replies Through E-Mail to: BenSells@Atari.org or Atari@aracnet.com. If you can't reach me, see my info at the Bottom!

Atari Jaguar, 8 Bit and ST Games/Software, Hardware/Accessories & References/ Books. And u dont yell arround how Aranym is Atari future, how new HW in work
is crap and so on... I like Ataris because of nice hardware they
introduced at time, diferent hardware and software we use.. And i love it
with good or bad points.. So what if i cant watch DVDs? Aranym pages make
ppl believe that now playing mp3 at 9% (7% here on falcon) and DVD/AVIs is
all we need..

Janez

P.S. I dont judge anyone using Aranym. It may be usefull tool, coding
envoirment, but its not Atari future... I speak for myself: at the moment
no new hw will came out, no old one will be possible to acquire etc, ill
switch platform.. but hopefully that wont make some time yet :))

> don't know if it's complete, and I know it's not quite as detailed...

Hi,

because u use Ident ("-- ") line, my client cutted off sig when i reply,
so thats okay. BUT put EACH piece of hardware in next line, of course write
all tiny bits till "sattelite speaker system" and multiply by 4, and ull
get my sig i could use.. Still, fact that u use the "-- " when signature
begins (i realy dont know why it is so hard for Carey to add that, if he
already has zillion lines) makes replying etc a LOT easier...

In the bag with the 1/4 W resistor is the 3 SMt resistors...check again.
Maybe somewhere in the packet if a small hole in the plastic bag.

22 ohms is not good !!
You have to use 33 ohms....and some case a 47 ohms for R221 is needed when
SDMa problem still with 33 ohms.
Sure I speak about SDMa problems with boosted bus...
At 16 MHz, 33 ohms on R221 is OK.
But at 16 MHz, the 1/4 W resistor may be needed on the SDMa clock input (see
the fitting manual).
In fact this resistor is recommended in all settings and all speeds.
So, if you can solder it, do it !!

615. Falcon issues

Newsgroup: comp.sys.atari.st
Date: 2004-01-23 17:49:22 UTC
From: Mark D <mducksub@removenoaspam.atari-source.com>
Message-ID: <pan.2004.01.23.17.49.21.872292@removenoaspam.atari-source.com>
Source record: 21304

Hey guys,

I decided that my Falcon issues have gotten above my reach and I decided that I'd rather pay for it than lose my hair over this. It's worth it to me considering the money I've sank into this already, so I decided to send my falcon and CT60 to rodolphe for the full work, 25MHz fitting, etc. Basically I hope when it comes back it can make it through a gcc compile at least ;-) On the bright side though, after packing up my falcon I was motivated last night and brought one of my TT's back from the grave from a lighting voltage spike :) It just has some keyboard issues and the video is fried yet, but it seems any number of video cards take care of that.

Anyway, I wanted to thank everyone for their efforts and for running the fputest. It puts things into perspective and helped us to realize that there's more than one CT60 out there with fpu problems too! Keith has more than one 060 however he just figured out his other one is surface mounted to his amiga accelerator ;-) So he's interested too in what the verdict on my falcon is, but I suspect there's probably something wrong with SDMA, the FPU is broken, something in DSP, and maybe more wrong with it. No one fix will take care of my falcon's problems, I'm sure of that ;-)

As I said, thanks for all your help... Just when it started getting so unstable that it won't even stay running for more than 5 minutes at a time, it's out of my realm of patience. Stay cool, I'll still be around compiling under aranym :)

Thanks,
Mark

Both machines are mounted to the underside of my desk. I can't see the
hardware, and when they're running, I really can't tell if it's the
"real" hardware or not (except for the speed of course). So to me the
labels on the PCB's and chips doesn't matter.

Okay, but for me they dont run a lot of Atari software. I dont expect
100% compatbility but let say some 30-40% maybe, to call machine "Atari" as
we meant it, ST>TT>F030 line of machines...

I would be very surprised if Aranym was less "compatible" than my
Milan. There are many good ST-emulators that are almost 100% compatible
(but also limited, as they're only ST's ofcourse), my Milan will only run
clean GEM-apps.

Can I use 47R for all 3 resistors ? I will solder the 1/4w resistor in also
latter. I checked the bag and there is only the cable and the 1/4w resistor.

I have tried Aranym, u dont need to explain me anything. Most apps i regulary use, dont work. Im not pure GEM user, there are non GEM apps which are better as GEM ones, and i use them often, and i definately dont give a shit if i cant watch DVDs on Ataris i own. Please spare me such remarks...

For Aranym, as new Atari hope i need to fullfill 2 things actualy, one is to get a PC and 2nd is to instal Linux (since only really usable version is Linux one). Interesting indeed.

Yes and Aranym does run few apps more.. Still no trackers, non gem painters, games... Those are "Atari apps" as well. And u know what im against. Im not against Aranym, or users of it, im against calling it new Atari, or best Atari, or Atari future... Aranym is an emu (or virtual machine) and Milan is GEM compatible machine. Thats is not a word to declare it bad, its just truth what it is. Same as for example new VW beetle is not the real VW beetle. Its faster, more comfortable and still any serius VW fan will say it has 0% feeling of original. My friend has Milan, use it a lot, he never call it best Atari he has.. And we dont have any squarrel bout it... As u have all rights to use Aranym, like it etc, i have same right to call it non Atari, emu or vitual machine, i dont offend anyone with that...

Janez

Well, to me the hardware plays a vital role. I point out that this might
be just me, but lets take oVDI which I'm working on. Do you think you can
use the driver written for ARAnyM on a PC with Radeon on a Hades with a
Radeon? The want us to think of ARAnyM as new hardware... well, lets
see...

Question to all,

If I install Mint OS on my Falcon, what software will I be able to run?

Thanks
Sam F.

Hi Mark,

Would you mind sharing what the cost is going to be for sending the
CT60/Falcon back (including shipping)? I'm starting to think that
might be a good idea for me too, although after spending $1000 for the
used Falcon, CT60, 68060, FalconRack, SDRAM, hard drive, HDDriver, ATX
power supply and various cables I'm a bit reluctant to spend yet more.

I ran the CT60 for over three hours yesterday in 256 Color mode
testing a good half-dozen programs. I couldn't believe my luck.
Then, a few minutes before midnight, I quit the last application and
decided to see what the temperature of the CT60 was before shutting it
down. As I started to move the mouse to the upper left corner of the
screen, the system rebooted. I'm going to see if I can find some
inexpensive CL2 SDRAM on the way home tonight, but frankly I'm running
out of things I can test, and a computer that occasionally reboots on
me is not satisfactory.

Galen

Indeed you can place one in the signature but AFAIK it won't work because Outlook won't let you end a line with a space. Outlook automaticaly delete that space. So you get (--) instead of (--). There exist a patch to solve this (and other problems). I believe it's called OE-QuoteFix.

Well that's my reasoning, it's surely something simple, something stupid
like my 060 is broken or my sdram sucks, or my chip doesn't like 66MHz,
but I don't have a 60MHz crystal, I don't have another 060, and I don't
have more SD-ram that is known working. Rodolphe does, and with that I
know he can get to the source of the problem, further he can solve the
SDMA (or whatever) problems with my falcon because he has the much more
expensive tools and knowledge to do it. IMHO if I pay under 200EUR for
the deal including replacement processor if necessary, then it's money
well spent, ASSUMING that it comes back SOLID and reliable, and by solid
and reliable I don't mean like my TT or my mega ste. I mean like aranym
:) Aranym can run for weeks and damn it I want an authentic atari machine
that can do the same. That said, my TT is rock solid, it's just giving me
issues tonight, and my mega ste, well I try the insane setups on that
thing so I'm asking for it ;-). Only machine I ever REALLY had problems

with was a Mega 2 that loved to eat HDD's and boy that really soured me (abandoned atari for years after that).

PS: I'll tell you in a week, that's when I get paid and that's when I can afford the shipping. Rodolphe if you see this, I'll let you know when I ship it but it won't be in under 6 days ;)

Thanks,
Mark

apologies if I'm posting in the wrong place

I have an Atari ST sitting in my garage - I bought it (with printer and word processor) for 2000k in the days when (in Australia) it cost 3000k minimum for a IBM compatible PC with dual floppy drive, no hard drive and no software/printer

but it sure aint had too much use in the last decade (lol)

what I'm wondering is (seeing its its now acquired a certain retro chic quality) - is there any way I could transfer MP3 files off my XP machine and hook it up to external speakers/sub woofer and use it as a juke box

is there such a thing as a good MP3 player for an Atari ST

Cheers, :)

You need at least Falcon to play mp3. Other machines are to slow (if not accelerated).

> Question to all,
>
> If I install Mint OS on my Falcon, what software will I be able to run?

Well basicaly all software u already use. However for games, and some rare apps u will need to boot into TOS, but thats not a problem with boot managers like Xboot etc. Next to GEM apps, u will be also able to run Unix like envoirment, such as Linux CLI and also some X windows apps. But i see u have 14MB which is kinda minimum for MiNT and also u can forget X windows applications etc, but GEM equivalents are great anyway. Unix like envoirment also allows to run Unix network daemons at tools like wget, apacche etc, again with warning that 14mb is not much... MiNT can acces normal Atari partitons as well, and most GEM apps can run happily from ext2 partitions as well, so not a problem.

U can also run "lite" version of MiNT, which is kernel+AES+desktop only, so uses less hdd space since no unix envoirment, less RAM, but usability is then on same level as with Magic basicaly (with some exceptions, but those may not interest u too much if no Unix part installed) so if u dont looking for open src and free OS (mint kernel+xaaes+terradesk), which is not yet on same level as Magic or mint kernel+naes+thing/jinnee dektop, which are commercial, also consider Magic.

Janez

Hmmmmm??? Strange... It should work. I would go to the Gribnif
website and email Dan Wilga. He is still around becuase I just
bought a copy of Neo-Desk 4 for my STe 4 which runs Geneva. Geneva
also runs on my Hades060 and recognizes the 256meg of Ram
easily....

I cannot believe that you are not willing to spend the money on
HDDrive and would just give up your Falcon. To me, that is the
only solution to yuur problem. I have formatted a SCSI disk using
HDDriver and it worked great. Do your Falcon a favor and spend the
money.....

For ethernet I would go with STing because the drivers do exist
for this. I use it with my STe, but I do use Gluestick with my
Hades. Both are connected to my Lan and to the Internet. Right now
the best browser is Cab, but Highwire is looking better an better.
I use Newswatch/Popwatch/Okami for newsgroups, aFTP for ftp sites,
MyMail for email, AtarICQ and AtarIRC.

It might be a little too long, but who cares. It just means he is
proud of his setup and he should be. Hey, look at mine. <g>

Does he have a backup HDDriver SYS file? That happened to me I
just copied my backup over the SYS file on my C partition and
everything was working again....

I kind of like seeing the Atari ads often. Reminds me of the days I was running a BBS with an Atari Mega STe 4.

If you impose a limit on someone's messages, do you limit your posts to once a month?

If you don't want to see messages from a particular source, just don't open them or block them.

Sounds like a freedom of speech issue.

I suggested single-posting a while ago, and also waiting till the last ones timed out before doing so, in what I hoped was a relatively civilised manner. Looks like Ben didn't listen.

If I were to have a definition of 'an Atarian', it would be a person
that uses Atari software. Not that I care one way or the other.

>Radeon?

So, you have access to Radeon documentation so you can write an actual
AGP/PCI driver for oVDI? If so, I'd be very interested in getting hold
of that (but not for the purpose of writing an ARAnyM driver, see below).
As it is, the only halfway modern cards I have documentation for are the
Voodoo cards.

Anyway, assuming you ported ARAnyM to run on the Hades, the fVDI ARAnyM
driver should work perfectly well there.
This is because the driver (well, the ARAnyM native part of it, the
68k part does not do much at all) does not attempt to use the graphics
card of the PC directly. That is often impossible due to lack of
documentation, locks you into a (or a couple of) specific card, and is
mostly pointless in any case since the API overhead when running on
modern hardware is not worth worrying about.
In the specific case of the current fVDI ARAnyM driver, it is very
much slower for many operations than it could be, since it uses the
SDL library for screen access rather than something like Xlib or OpenGL
(there are plans to develop one or both of these, though). But it can
still beat current hardware accelerated graphics on 68k Atari
compatibles (not necessarily for all operations or for all combinations
of hardware and software).

> The want us to think of ARAnyM as new hardware... well, lets see...

Well, any Atari software that does not access any hardware directly,
and is OK on a modern 68k cpu, should run under ARAnyM.
Just as would be the case for an actual machine built to run (a modified)
TOS on a modern 68k cpu but without supporting any of the 'legacy' chips.

"Time out" in the meaning "not being present on your newsserver" varies
alot from less than a week to very long time, several years at least.

He gets his word out and the usual opponents get a chance to clatter with
yet another useless complaint. So far Mark D and Joakim Hï¿½gberg from
c.s.a.s alone. Email to Ben direct or shut up!

I must admit the main reason I have not registred Aicq (by Hï¿½gberg) is
actually his complaints about Ben Smith's ads.

Hi Janez!

I agree about the signatures and what has een said about excessive
lengths. But the reason for this post is to ask about the headers.
As you say, most readers cut off all but 2 - 3 lines of the
headers - my CixRead does in most cases. BUT there are a few
usenet posts where a much longer header appears in the reader. Any
idea why?
Here is one that does this - the lines displayed are prefixed '#':

I'm so very sorry, I haven't made a sale in over a Month, yet the bills keep coming in. It's hard now not just for me, but also Brad at Best and Lance at Video 61.. I know since we all keep in contact. Even with our Banner Ads on Atari.org things are painfully slow. I tried to Drum up some business. So I tried some new Ads. I wonder if Best Electronics or Video 61 Ran Ads here, would they get the same response? ===Ben===

For me also !!!

Everyone who run Atari software,need :speed,high color graphics,16bit sounds
network,and with Aranym you have everything !!!Also invest in one Aranym
system is
not expensive !!! (AMD 2600+ for example)

Hmmmm..... Seems Ben is the only one around here doing any selling, in a For Sale news group.

And to qualify as a legit post, I'm selling my 2001 Cadillac DHS for $55,000.

Cash only. And will accept a best offer above the selling price.

Don

As i said, there are each individual piece of common hardware listed,
even incoming ones.. On yours there are also listed programs u use.. But
alteast smaller form and client cut it off. I use a lot of Atair hardware,
lots non specific stuff like Riebl card daily and i dont see urge to brag
myself with that, down to the last detail... I realy see no point of that.
However, ppl can have their systems explained much better on www pages,
even with pics and so on, and of course add link to signature. And i do
like to check such links. and of course add the so hard to use "-- " string
or some other meaning to ident signature...

I am not sure what was meant by his question, byt maybe this helps:

All the peripherals of a MC68000 CPU are memory-mapped into one of
eight (or is it seven?) 16MB address spaces, i.e. there are no separate
I/O ports as with some other CPUs. By ST designer's convention, all
device-controller chips on a ST are mapped to fixed locations in a certain
subrange of the address space.

Sort of a Turing test, he he :)

Btw. I know that it has been ben stated long ago by a member of the
Aranym team that one of the long-term but low-priority targets would be
to create a cut-down configuration of the host operating system (which
could be installed from a couple of floppy disks) which would boot Aranym
immediately. I think that it would help promote Aranym's cause greatly
if that target was given a higher priority, so tht one can start from
a "clean" machine and simply arrive to an Aranym-only system. For the
purists, one need not call that software "host operating system" at all,
it can be "console firmware system" or something like that, similar to
which exists on some more powerfull machinws which boot a quite
sophisticated "console" before booting the "real" OS.

Why so rigidly prescribing what is ortodox and what is not ;) What is
wrong with running TOS-compatible OS on a machine which is designed to
run any operating system?

I guess im not EVERYONE then. Go propagate buying cheap computers (PC) somewhere else please. Excuse, that chip label dont count, is not the right one. Aranym is not an Atari, esp since it lies on alien OS regardless if run on Mac or PC (intel/motorola). No Linux/Windows equals No Aranym, so please stop talking about Atari system. It is Windows/Linux system running Atari emulator.

Speed is relative, Ct60 costed 200E, high color graphics we can have already , better one with video cards, network we have already, and 16bit sound: dont make me laugh, Falcon can blow Aranyms sound abilities away anytime.

>Archview which works alot better....

Assuming you mean Arcview, that only acts as a shell and still
needs a ZIP.TTP to work! I use ZIP 2.3_02 for zipping and
UNZIP540 for unzipping, as well as LHARC030 for LHZ compression
and expansion, and it works fine, with LFNs as well when used on
a LFN-enabled partition.

If you like I could mail you my ARCVIEW.CFG file (though your
filenames may be different).

>talk about subjects...

I've got the only known remaining drum machine ever made by Allen &
Heath (mixer makers) - every one of the 140 made I've been able to track
down has been dead due to PCB/battery/other failure.

I've got not only a rare (estimated around 50 made) Acorn Cambridge
Workstation, but also two prototypes, an ABC-110 (quite common, still
less than 50 though) and ABC-310 (seriously rare). And I had one of the
400 rev. 6 BeBoxes.

But you know what? I doubt that Carey's 'experimental' computer is
anything that will make a dent on the computer world. Sorry to burst the
CT60 bubble, but it's an enthusiast machine. Yeah, I like them, but I
also like Iyonix, and Omega, and a whole load of dead ducks. Not one of
them would have the horses and applications to knock the G5 from my
studio, the Powerbook from my lap, or even the 5-year old Dell
workstation from my office.

(Well, my own G4 might do that).

Now, if Carey has a rare 2.5GHz 970-based G5 or something, then sure,
it's experimental right until 500,000 people buy them in summer. And I
doubt that, he doesn't have the brains to use Usenet with any manners or
common sense. I reckon it's more likely to be experimental like "Hey, I
made a 6502 board with GALs".

Richard

> juke box
>
> is there such a thing as a good MP3 player for an Atari ST

Unless you get a PAC030 (Expansion board with fast 030 CPU and fast-ram), I
don't see it happening.
I really don't know if even a PAC030 is up to the task?

FalcAmp will decode and play mp3 on Falcon compatable machines.
FalcAmp, if I recall correctly, relies on the DSP chipset, which an ST does not
have.

AniPlay once did, I'm not sure if mp3 codecs are still avilable for this since
patent owners of the mp3 format at some point announced that they would be
collecting major royalties for any software using the routines. This may have
changed, but it was at one time an issue. Provided you can find an mp3
library/plug-in for this, it may also rely on the DSP chipset or a very fast
emulation of it.

The ST just doesn't have the mips to decode mp3 in real time.
Even if it did...the sound hardware of the ST is 8bit....so music is gonna sound
more like a bad telephone where fidelity is concerned.

Your ST will do the following things rather nicely:

1. Run MIDI based applications...external sound module needed.
2. Desk Top Publishing and page layout. PageStream is really good low cost
package. Higher end stuff like modern Calamus is very powerful, but can get
quite expensive, then there's stuff like Papyrus, which is a little more like
the Atari Works suite but much more modern in terms of color support, fonts, and
the types of documents it can import and export.
3. Games games and more games. These days there are tons of so called menu
disks full of all the old classic computer game hacks. Also, you can find
several Atari shops and ebay acutions dumping slews of games for $5 and less.
Of course they don't come anywhere close to a modern PC, PlayStation, Sega,
Xbox, etc....but alot of them are still very playable, fun, addictive games
that'll keep you busy for years.

Everyone agianst SIGNATURES,
Heres the problem you guys dont like SIG because of
the LENGTH. Sorry the last time I checked here in the
USA FREEDOM of SPEECH was still not dead. This is
like e-mailing someone and telling them that you do
not like there WEB-SITE and that they need to change
it. BS guys its time to grow-up and accept that this
SIG is staying and may even get larger if I SEE FIT.
JANEZ, this has NOTHING what so ever to do with you
choosing MINT over MAGIC. Fact is I have been
pondering a MINT setup as well on one of my many
FALCONS for quite some time. I just dont have the
time at the present moment, been working 60+ hours a
week for over 3 months, so that does not leave alot of
time for my computer. This is one reason I have not
designed a web-site as well. Plus lack of time on
figuring out a NICE design and layout for a web-site.
Not to mention my wife is expecting our first child in
less than a month. Do I really have the time, I dont
think so. Unless someone really wants to help out
with this and volunteer there services. See we are
all in the same boat guys. We love our Atari's and I
just happen to be one that shows it. As far as the
experimental computer, BELIEVE it. If I told you what
it was you would probably want one as well, TURST ME
on this one. Especially if you are a TRUE die hard
Atarian like you say you are.

Thanks,
Carey Christenson

/ | \
/ | \ High Flying Falcon 060!!!

Falcon 030 @ 16 mhz. with 14 megs STRam
CT60 68060RC60 @ 72 mhz FPU and PMMU built in. Kingston 512 Megs PC133 SDRam

True, the ST memory map is pretty close to the Motorola design map, pretty
interesting stuff. I'm thinking that the CPU can only do one thing at once,
ok its probably doing a million things though its intructing by instruction
so its one thing at once. Now when CPU time goes to fetch ram for say the
video shifter, then at some point the CPU has to say "hey shifter take this
info" and it does, plus everything else such as I/O ports etc have to be
disabled else everything with a databus will get the video data and
bascially printer,floppy drive etc would go mad, so these must be disabled
while the CPU is taking care of video data, The shifer has what seems a CS
pin so bascially this should say go high when the MMU is inputting data to
the shifter and CS goes low when "its not its turn for data" this is the
kinda thing im trying to figure out.

Chris

>I had all kind of problems with ST ZIP 2.6, so I switched to
>Archview which works alot better....

I ftp'd the 240 MB zip archive over to the pc and yes, there were
errors...

I usually don't transfer very big files to/from the Atari and noticed a
weird thing with FTP-SERV.APP with STinG. At first it send data quite
fast but the speed gradually goes down _and_ gradually uses more and more
cpu. At the end of this transfer the speed was down to a quarter of start
speed and Okami got almost unusable due to slow redraws. Tried to check
for new mail/news and both timed out. Not even Ping to the gateway got
through. No heavy load on the Ethernet line at all and the ftp transfer
continued without errors. Right when the ftp transfer finished things got
back to normal again.

Makes me wonder if the same happens using MagicNet?

I did a clean floppy boot with the HDDriver floppy so it's definitly an
hardware issue. The drive and cable still works perfect on my TT but not
on his.

I guess I should take his internal drive out and try his computer with my
internal drive as well and see what happens. Might be his SCSI or power
supply dying slowly or something. The external drive has its own PS so
that is not the problem. could also be mains 50 Hz interference as his
outlets have no ground (older house). 230 Volts in the wall and if
something is faulty and you touch it and the water radiator there is a
50% chance to get a surprise that may put your hart to a full stop.

fapfapfapfapfapfap

You know. You sound like a nice guy and all, but you're a bloody moron
if you think ignoring common sense over your signature is some freedom
of speech issue. The founding fathers would be disgusted.

I found a way of snipping your sig. It's invariably more interesting
than the content anyway. *plonk*

BTW - it'd take five minutes - if that - to knock up a plain text HTML
page and cut down your sig to 4 lines of relevant info, Here's a sample:

--
||| High Flying Falcon 060!!! - CT60 @ 72Mhz, 512Mb/164.5Gb
||| 4Mb ATI Rage IIc, CD-R, Ethernet, Stylus 880, 19" Samsung VGA
/ | \ Subwoofer/Satellite Speaker System.
/ | \ Coming soon! CT60 graphics 64Mb, PCI/AGP, 20/25Mhz Falcon Bus!

Don't say we don't try to help you look less like a moron. Honestly, the
brand of RAM is meaningless.

Its not even remote like this and has nothing to do with freedom of speech in USA or everywhere. If u choosed to use long signature, atleast add a limiter on start of it. It is written in every rule of good behaviour on internet, it is polite and virtualy no problem for anyone to add it. Its 3 characters for god sake, not something hard and complicated. It would take u 20 secs, and thats it.

To conclude, using signature separator is polite and encouraged bya all guides of good behaviour on internet. Since u choosed to use long sig, it would be in order to use the separator. If u are inpolite and feck all of us and proper manners and dont care at all for the rest thats your choice... I guess it just reflect the personality...

U realy believe ill believe something on what base? Trust? Sorry cant do that. I like my Ataris enough to use them, buy upgrades, code on them, and have fun with them, with good or bad things. Dont have to prove anyone how true Atarian i am. Monster sig, or fact that i have less or more machines as someone else, doesnt realy make me better or worse Atarian.

Brian,
My Falcon in stock form could play MP3's with
Falcamp without problems. Before I got the Eclipse
graphic card Aniplayer would skip playing MP3's with
DSP enabled. When I put the Eclipse graphic card on
my processor load went from 90+ percent to an average
of 50 to 70 percent just by adding the Graphic card.
But to answer whether a ST would be up to the task.
It is very doubtful. My CT60'ed Falcon has an average
CPU usage 2 percent or below. When I turn the DSP OFF
it goes up to 5 percent or below. Besides I think
Falcamp looks for the DSP anyways. And Aniplayer
needs alot of processing power. So a slightly
modified Falcon would be bare minimum I believe.

Thanks,
Carey Christenson

Ask that of the many people enjoying their huge IDE drives, mountains of
RAM, PCI, USB, 060/PPC etc etc

The A4000 blew it out of the water with it's level of expandability.

> You're completely mad. AmigaOS may have had some good points, but it was

Rubbish. TOS/GEM is a single tasking hybrid relic that belonged in another
era when it was released and Atari users have been battling ever since to
get something useful for their machines.

As for OE, I have the Mac version, and it works ok, but I absolutely
can't stand the fact that it doesn't allow you to simply check mail
before downloading it (the way Newsie and Marathon Mail do - letting
you see the author, subject, size, etc. and letting you choose to
delete it without having to downloading it first). If I'm away for any
length of time, I have to either sit there for an eternity waiting for
OE to download the tons of spam coming in, that I will just delete
right away anyway, or use my Atari and do things "right". Atari
clients are *MUCH* better in that respect - they are usually more
practical.

As for Draconis, the latest version of the web browser (Adamas) is
from September. It's usable, but still quite buggy. I use it (well,
try anyway) with MagXNet's DracEmu, because the Draconis stack itself
won't run for me. I can set it up fine, but when I reboot and try it,
it makes Thing think I'm in singletasking mode, no matter what I have
it actually set at, and unload itself. That aside, it won't connect to
my ISP, either. So I gave up on it. The other clients seem pretty
good, though. Marathon Mail has some nice features, including handling
multiple accounts like OE. It does have some minor bugs, which you can
learn to get around. DracFTP *looks* nice, but doesn't function
correctly with MagicNet because it can't get my IP number. Adamas, as
I said is buggy - crashes all the time on sites that CAB handles well
- but can handle *some* Javascript, which CAB won't do at all. It
looks like it has lots of promise, is much farther along than
Highwire, and has a ton of cool features, if they ever get it stable
enough.

CAB, last I heard, wasn't supported anymore (although I may be wrong).
It's quickly getting to the point where it's not really usable for me,
which is why I was forced to get a non-Atari computer a few years ago.
I still use my Atari more, though.

Don,
It was cross posted over several news groups....some set aside specifically for
marketing, some not.
Which leads me to this 'opinion'.

there is no comp.sys.atari.marketplace newsgroup.
That's not Ben's fault.
Where should he post?

So many folks demand free-ware and open sources....free information....but free
marketing is an absolute nono? Kind of hypocritical isn't it?

The posts don't bother me, nor do the complaints about them; however,
I really don't understand the personal attacks all this brings about every time
Ben posts anything here...ad or no. Some of it is down right vulgar to the
point of pornagraphic and intensely violent. There's simply NO CALL for
that...disagreement or not.

Brian

> era when it was released and Atari users have been battling ever since to
> get something useful for their machines.

Yes TOS was single task OS and defintely not advanced such as AmigaOS.
However im glad it was so. First of all it was very compact and sitting in
ROM, next it was FAST and on end it also included some sort of semi
mtasking thru .ACC modules. Result of all that, together with hi-res mono
monitor, still one of best and most solid screens i ever saw, was a machine
usable and a lot faster as Amiga for DTP, Midi apps, CAD/CAM and such.
While Amiga was better for raytrace apps etc.. The A1200 i have, is slower
with OS wise apps as my ST, and very serious apps such like Calamus,
Cubase, Signum, Papyrus runs faster on humble ST as lot smaller apps on
Amiga 1200. And we got Magic OS later, amd MiNT and so on.. Amiga OS was
inovative i wont deny it, when u get used to screens even more, but it was
to big, to bloated for even plain A1200. Fact remains, that ST and Amiga
were and ARE different, thanks good for that. Facti is also that many STs
are still in serious usage, mainly in studios, unmodified and with relic
TOS, reason is what i said: compact, ultra solid and fast.

However, not to sound unfair, in contrary to STs hires mode and MIDI and
small OS (which was way developers choose, acording to Shiraz), Amiga had
some nice hardware advantages, mainly great blitter, sound hardware, so it
surely had moments in gaming, demos and due to video in gfx segment. ST
potr of DeLuxe paint was cool and very nicely done, but 4096 and some other
butons were "greyed out".. They were different machines, aimed toward
diferent users, and as is see they stil catch fans hearts... Sadly, the
already mystical Amiga owners attitude (to proud, spitingon everything
else) survived as well...

Janez

You are clearly posting to the wrong newsgroup here. I know perfectly
well, as other also know, what one can do with Atari in 2004. This groups
is about Atari and its OS, not how fast emulation of our OS runs on other
platforms. I think most of us in here are aware of that fact as well.

No u dont.

> You can take all acelerator and what you want ,and dont speak me about
> motoroala 030,040,060 ! in 2004 !!!

And why not? they ARE the heart of Ataris. I run website (apache), ftp server, unix os, and use daily the 030 based machine. And it does all nicely. The only thing i use PC for and not Atari are newsgroups infact. No realy good reader for news, and i dont like pine for newsgroups. Knews is nice, but have issues with sending posts...

> And also you have to know Falcon is far from good sound !!! (motorola DSP
> old one) !!!

Please dont make fool of your self. Falcon can drive 8 16bit 50khz channels at same time, with realtime effects, even with "old DSP". It can play SNDH files, it can play a LOT of trackers, it can play Falcamp, on CT60 with 2-3% CPU usage, it can play Aniplayer with 6-7% CPU usage (with ct60), it can play cool ACE softsynth, it cam play FlaySID, it can play GTracker mods,and so on... Apart from Aniplayer, what of those apps u can run on Aranym. Also it can use digital out, so u dont need to use bad quality headphone/mic output. Now name me ONE application from above, except Aniplayer, which use any of features today good PC cards offer, to beat Falcon?

> And tell me can you go to shop and take new Atari ?

No u cant sadly. U can't at all. Even if u buy PC, u will not get new Atari.

> And Linux is damn good OS,far from TOS !!! is not the shame to boot Aranym
> with Linux !!!

Who said Linux is bad or shame? And what TOS has to do with it? Fact is, if u need to use Linux or Windows as NATIVE OS to run Atari EMULATOR, then machine is NOT ATARI. And we mainly not use TOS, but Magic or MiNT, which is btw, nice Unix like os, with comand line unix, ext2, unix networking and GEM GUI.... And even if u hate TOS, it is ESSENTIAL for booting aranym...

> And you can go to propagate story's about Falcon and something like that
> somewhere else !!!

Realy!? Where, in Amiga group? PC group? Acorm group? Mind u, this IS Atari group.... U want anyone that not think like you to go away?

> Real Atarians need good and fast machine,not 16,......100Mhz c'mon !!!

Real Atarian uses real Ataris. Even if they have bad points, or not 10GHz processors. Real Atarian for sure dont yell real Ataris are crap. Real Atarians dont push ppl to propagate Atari "somewhere else". Real atarian dont cry and moan if dont have 10ghz, they just use what they have, and seeing Atari software, they doing it WELL!

But tell me this: what new Aranym brings to scene, apart from speed? TT/MSTE/Falcon can have GFX cards. Each machine, when introduced, allows and trigger users to make new and beter apps, using new features those machine brought... Last year we got ACE, totaly new type of application for Ataris etc. What NEW Aranym bring us? Its some 30-40% compatible, dont offer anything new to Atari except speed, which is not something i call essential. Tell me one Atari application, developed on Aranym, which uses NEW resources Aranym (not) have, so we can have something new and revolutionary? Aranym can only run Papillon etc faster, not too good, if u know ESCPaint or Apex are way better anyway. Does NeoN use any of 3d gfx power on Aranym? Does Cubase use resources of modern PC Sound cards? Does new, better software for GEM to use those good resources exist? Can u tell me one thing Aranym can do and Falcon can not? (mind u, Falcon CAN play AVi, divx etc, just very slow) I can name u a LOT of Falcon apps which can NOT run on aranym. I can name u also a LOT of apps which runs on ST/TT and Falcon (so u cant blame Falcon specifics) which dont run on aranym, and so on...

Janez

P.S.: to other aranym users: Even if it sound so, im not against aranym, i realise it may be nice tool, it is very usable and it did start as nice aproach, it is imho way nicer as MagicPC/Mac and others.. I just dont see it as Atari machine/hardware. That is all. It is a virtual machine or emu or simply aranym (altough it only work ok on PC) same as Milan is not Atari, but GEM compatible. Good one if i may say... And word "GEM compatible" is not something bad or meant to be bad... its just a fact.

Yeah, all kludged on. And costing rather more than just going out and
buying a Mac with PPC/USB/PCI etc.

>The A4000 blew it out of the water with it's level of expandability.

That's rubbish. The A4000 was out at the same time as the IIfx, which
was faster, and machines like the 840av, which simply walked all over a
stock A4000.

>Rubbish. TOS/GEM is a single tasking hybrid relic that belonged in another
>era when it was released and Atari users have been battling ever since to
>get something useful for their machines.

Yes, but I was saying that the Amiga isn't as good as a Mac. Do keep up.
Mac OS, by the time of the IIx, was generally 7.1, which was
multitasking, and offered a lot of features we take for granted now.

As it is, I happen to find single-tasking TOS more useful than Workbench
anyway.

Message-ID: <4013acfd$0$28870$afc38c87@news.optusnet.com.au>
Source record: 21197

Hi All, just picked up the new TT. It is very under spec. No TT ram and only 2Mb ST ram. Also only a very small hard disk. So onto my dumb questions (being that I am used to Falcons).

1 - What is the biggest drive that can be fitted internally? It was fitted with a 200Mb Conner. I have had zip luck with a Quantum 2.1 ST. Only ICD utils will even detect it. AHDI 6.06, and Hddriver 7.6 will not recognise it all. The drive is set to ID0 and term is on. The only other drives I have are bigger than this. Oh, and what can TOS 3.06 handle natively?

2 - How about ram expansion? 2Mb is less than my ST's. I had to resort to NVDI 2.5, because after installing NVDI 5 I only had 200k free. What are the limits to the TT's ram expansion?

3- Also VME cards? What are available?

Got to say tho, it is a bloody quick Machine:-)

Regards

Mark Bedingfield

Hello all,

Nima of Homa Systems had posted an email some time ago about a great deal on the Umax Astra 2200 and how it would well with Scanx. I bought one (only $20), but Scanx does not recognize this scanner. The name of the scanner does appear in Scanx's box, but still nothing. I was wondering if anyone else bought this scanner and has gotten it to work. I hav emailed Nima, but he has not answered me as yet. I am sure all I need is a little upgrade. This is a great scanner and I would love to get it working....

Humm there are just a big problem with Aranym, a good speed is just for
PC, no JIT for Mac (PPC).

And I hate X86...

I haven't tried Aranym since I have my CT60, I have an Imac G3 500 Mhz
(<=> CT2 under Aranym). With this machine I can compare the speed of the
CT60 to MagiCMac (OS9), same results with DivX movies.
My CT60 with the old DSP has better results with MP3 than Aranym PC ;-)

Regards,

Didier.

Sorry, but pre OsX Macos is a crap!! Type/Creator bits are annoying as
hell. I know many newbies to get frustrated by that a LOT. If u dont have
app file was created on, u need to fiddle with FilleBuddy etc, if there u
imported a lot pics from internet and have not configured inport filters u
had a lot of work. I realy dont see much of features Macos introduced and
we have them for granted.. Sliders sux, if u select 10 files u got no info
how much place that is, GetInfo opened 10 separate windows with info,
fileselector sux and so on. Without zillion 3rd party startup apps pre OsX
are crapy indeed.I have 3 Mac's at home, and they are only machines i never
drag from closet. Except 640C which i sometimes drag arround to play
Barrack, i love that game. Not to mention its slow. I have 75mhz PPC
machine here, it drags as hell, ct2 machine (030at50) is a lot more
responsive, plays mp3 easily, Performa cant, many tasks are way faster on
ct2. The gfx is better on performa, but thats all.

Well forgot to say this: mtasking on macos 7 and 8 is a joke! If i used browser all the rest waited, if i play simple .MOD file the rest was sluggish. Moving mouse make music to choke and so on... Amiga has proper preemptive mtasking, just 68000 was to slow... But using my 640C or Performa (75mhz PPC) using Macos 7.6.1 is a pain... Instaling Macos 8.5 on Performa introduced nice look, no real new advatnages and make is even slower, a lot! When ct2 (030 at 50mhz) can play mp3 in background while system dont notice it, display jpegs at same speed as PPC 75mhz, run 16 channels, 16bit 50khz, or 8 channels at 16bit 50khz with realtime efects as reverb, echo etc on EACH channel, play mpg movies or avi's (lowres) while 75Mhz PPC crawls like snail, etc there is something wrong....

I dont think its some special size restraint, as long u use hddriver. Few GBs or few 10GBs for sure id say. But i think TOS 3.xx partition size is limited to 512Mb? (TOS 4.xx has 1GB limit)

> 2 - How about ram expansion? 2Mb is less than my ST's. I had to resort to

256Mb if im not mistaken, with AiXTT. But im, not exactly TT expert, may be wrong here....

> 3- Also VME cards? What are available?

Gfx cards, ethernet cards... I have RieblTT VME Ethernet card, works lovely...

I suppose a Jaz is just like any other SCSI or IDE HD... Never format a HD! They were formatted when new and the formatting sheme is platform independent. Only if the drive has bad sectors it might be of any use to actually try o reformat it.

What you want is to partition it with Atari compatible partitions! This will wipe out the Mac partition data and make the drive like new.

>GEM GUI.... And even if u hate TOS, it is ESSENTIAL for booting aranym...

Remember that Linux can run on genuine Atari hardware as well! And, as
you actually need TOS to boot Debian m68k things get a bit complicated...
Is Linux just an emulator running on top of TOS. Is BIOS/XBIOS part of
TOS? etc... I suppose Linux accesses Atari hardware direct, though.

And now comes the funny part... Aranym is present on Debian m68k so in
fact you could perhaps run Aranym on real Atari hardware as well!

There was a discussion if "emulators" should be permitted at the Nordic
Atari Show and I tried to actually run Aranym on my TT :-)

Aranym is available via APT (Advanced Packaging Tool) in m68k and it
installed just fine but exited with errors when I tried to run it...

On the other hand I never got X running in the first place on Woddy but
might give that a try again some time. I have discovered I used wrong
addresses for my video card (et4000) in BOOTARGS:

-s -k linux.bin root=/dev/sdd5
video=external:1024;768;1;n;0xfec00000;;0xfed80300;6;vga;1024

When it (for monochrome) should be?:

-s -k linux.bin root=/dev/sdd5
video=external:1024;768;1;n;0xfec00000;;0xfed00000;6;vga;1024

I would really love to se Aranym running on my TT just for fun... Who
knows, it might be usable as JIT should not be needed :-)

> Real Atarian uses real Ataris. Even if they have bad points, or not 10GHz
>processors. Real Atarian for sure dont yell real Ataris are crap. Real
>Atarians dont push ppl to propagate Atari "somewhere else". Real atarian

>dont cry and moan if dont have 10ghz, they just use what they have, and

From a purist or collectors point of view this is perfectly true. As a comparison I tend to drive my old DAF car in summer because it is more fun etc... I would never even dream of building a V8 hot rod that looked like a Marathon Coupï¿½ but is in fact just an external replica...

> But tell me this: what new Aranym brings to scene, apart from speed?

It brings the possibility to get a TOS compatible computer without the need to search around for old second hand stuff. Eventually all genuine computers with the Atari label on them will come to a halt. At that time maybe it will be possible to run Aranym on an IBM compatible emulator or other kind of virtual machine, who knows...

>P.S.: to other aranym users: Even if it sound so, im not against aranym, i
>realise it may be nice tool, it is very usable and it did start as nice
>aproach, it is imho way nicer as MagicPC/Mac and others.. I just dont see

>or simply aranym (altough it only work ok on PC) same as Milan is not
>Atari, but GEM compatible. Good one if i may say... And word "GEM
>compatible" is not something bad or meant to be bad... its just a fact.

This is all true but the distinction between hardware and software is not at all clear any more! Just think of CT60 that is actually running on "programmable hardware" whatever that means...

Publish and Subscribe, drag and drop... few others. I agree about the
resource forks /except/ that you can easily add an extension to the
filename for non MacOS machines.

OS X kicks arse. But then it should, it's Unix. OS 7.5 is poor, OS 8
sucks, OS 9 is good again. Performas were never very good, but the
8500-9600 models were great.

Im not sure if drag n drop was initialy MACos invention but who cares. Virtualy ANY OS in 80's introduced something new etc. I do know Performas weren't any good, but i wanted to illustrate that what Falcon "loose" with not so advanced OS/CPU it may gain thru custom chips and programable DSP etc, and that is VERY VERY hard to say what system is best. Mac lost a lot thru realy dumb OS, cute, but dumb... Each machine has pros and contras! Atari and Amiga scene argued forever, Mac one was kinda detached and ignorant and self sufficient, if thats the right word, but arround that time, late in 80's, Acorn scene was quiet and they produce realy neat and powerfull machine, the Acorn and RiscOS.. I get me A4000 last year and i like the machine...

>All the 150 - 18 = 132 users are happy it seems...

Yes. I am quite happy with my ct60. It is fast and very very stable. Compared to my afterburner it is quite a good piece of hardware even at such an early stage after its release. My afterburner was only stable two years after its release and it took independent developers (D. Little, S. Curcic) to remove all the bugs.

Unfortunately there are still three minor issues with my ct60

1.) When scrolling under N.AES (XAAES runs fine) my computer sometimes freezes
2.) Floppy disc accesses do not work
3.) My NOVA refuses to work (I didn't find the time to do further tests so it is not ct60's fault

I am really optimistic that point 1 and 2 will be solved soon. :-)

I agree that the Falcon Rack is a better choice. Besides the fact
that the Desktopper is hard to find, reports were that it looks a bit
on the flimsy side (even though it isn't). The Falcon Rack is well
worth $100.

Alternatively, look at back issues of MyAtari. Someone (Lyndon?)
wrote an article about a year back describing how to case a Falcon
into a full tower case. The process appears somewhat time consuming,
but not overly difficult.

You should try CAT (freeware) as your newsreader. To be honest CAT was the
main reason why I stayed with my ATARI during the hard years.
So today I am using my ATARIs again for mainly every task not only
newsreading. :-)

BTW, I just released an MP3 Tag editor (http://mpti.factorynews.de) but only
in German language. Are there any volunteers that can translate the .RSC file?

I dont know how uptodate the wizztronics page is, but the bare rack listed there is $250.00, or $450 with p/s interface and cable kit.

If one was to get just the bare case, how practical would it be to asapt the rest from spare parts?

Freedom of speech has nothing to do with repeating a message over and
over. It's not your message's length that's troubling, but the
constant repetition.

> Unless someone really wants to help out
> with this and volunteer there services.
Richard has come up with a four line signature for you.

Why? If you were "proud" of the computer, you would probably have it
in your signature, would you not?

I appreciate your activity in this group. Yet to refuse to defer to
etiquette seriously harms your goodwill and annoys the very people you
are attempting to communicate with.

When I first heard about Aranym I misunderstood what the aim was.
I thought it was going to be a system that provided a method to
boot into a TOS (Mint, Magic etc) system on any hardware without
using an existing, underlying OS.

I am not against Aranym, I just prefer not to have to maintain
two very different OS on the same box.

If the machine boots without ever having to see, understand
or maintain anything about the OS that is bootstrapping the
TOS OS then I might be converted.

1. 4 or 6 Gb drives should work nice...check there is ni SCSI ID clashes TT ID 0 HDD ID 1 etc
TOS 3.06 can handle up to 12 Gb with partition being up to 1 Gb
2. that's a tricky party since you have to solder memory modules - I think it can have up to 20 Mb
3. there were many VME cards but you'll need luck to find them :)

To Everyone agianst long SIGNATURES,
I have taken the time today I agianst my better
judgement to go through my SIG used in this newsgroup
and shorten it somewhat. I hope to someday make a web-
page but TIME does not allow me to do this at this
point in time. As stated before my wife is expecting
our first child and I have many things to do before
the big day not to mention 60+ hours a week at work
for over 3 months has made it hard to find the time to
do anything extra on the computing end of things. If
anyone could recommend an easy program for the Falcon
I would love to start a web-page for people to visit.
Any SUGGESTIONS??? For all those people screaming at
me to add the <-- > I have also done this as well.
All though I do not see a big deal with cutting that
out of the response. I guess any help on a program
that can help make a web-page design on the Atari
simple let me know.

Thanks,
--

Mark,
I agree with JANEZ on this one. With TOS 3.06 you
are limited to a 512 meg partition with the TT030.
All though hard drive capacity can be as high as you
wish. Although I would imagine a 5 to 12 GB SCSI
would work nicely inside the TT030. This of course is
using HDDriver from what I have heard and understood
about the app. Also I believe JANEZ is correct on the
TTram as well (or FASTRAM as it has come to be known).
I have heard of issues with the board AiXTT
especially when it comes to the type of RAM used on
this board. You may wish to get ahold of people using
this board via this newsgroup and aske specific model
numbers of RAM that they use. I am not for sure on
the VME adapter part of the TT030 or the MEGA ST but I
have done some research and it seems that Gfx card and
ethernet cards are available I would imagine that
there are many other boards that can be plugged in but
it maybe difficult to find new but second hand maybe
an option for you.

Thanks,

Hi folks,

I've to accept it, I don't have any time to develop this project anymore. The more time goes, the less it is easy for me to get in conditions to continue Organizer. School really sucks up my time !

So I wanted to know wether someone would be interested in the sources for Organizer. If it is, I'd have to ask Jean-Marc Stocklausen for his agreement 'cos he gives his contribution to this soft. And I'd have to do the same with Holger Herzog, faceVALUE' main programmer 'cos Organizer is built on it.

So just tell me... I'd prefer seeing this project in other hands than with a "RIP" inscription on it :o)

Regards,

Mathieu

> America's idea of freedom of speech is to bomb the people who don't agree
> with them until they do agree, then they consider them liberated and
> thankful!!

Here they go again with the Anti American nonsense.
This is such a backwards statement.

If anything, America is more like a very divided preach to the choir society with choices everywhere. If an American doesn't like what channel X is saying, he turns to channel Y, and sez, "Amen!" And all these channels drop their bombs, changing no one, and not even trying really. No one in America has a mandate, and no two are alike.

Unlike any other country, the US is wide open. The whole world sends their hateful garbage and propaganda in. They send their starving and diseased people here to be taken care of while taking out as much wealth as possible. They support tyrants and villans who openly hang women and children by their toes in public squares. They snub their own leaders with ANY common sense at all, simply because once in a blue moon such a leader sides with the USA, instead of the likes of people who would gas and torture entire races just because they have the wrong last name or religion.

When millions of people write every day, "We are desperate, hungry, and helpless, come help us!" And these same people are being shot for daring to mutter such words. And you choose to side with those obcessed with 'technicalities', so they can drag the suffering out a little longer....squeeze a few more franks out of the tyrant before stabbing him in the back. When that is the way you'd rather things be, then it is clear that YOU have NO IDEA what an American's idea of freedom of speech is.

Think and say what you want.
Lets just pray you never have to experience what it's like for people in the world who do not have freedom of speech.

You don't seem to understand at all.
Americans are the people that were shot, hung, gassed, patronized, and worse....BEFORE making flight to a new world. And they still come every day....from all over the world, seeking freedom of speech. These are the people who tend to have something to SAY, and it's a very divided land on every issue.

You are clearly too shallow to understand the complexities of a republic, and the amazing variety of people who make such a republic. And it is you who might live in a land where a speech bomb is dropped daily. A speech bomb with only one simple goal, and no real substantial arguments at all. "Be Anti American Today! It's cool and retro to hate Americans! Just like Atari!"

Bah!

Brian

personally I have no problem with sporadic ads but 3 ads per post is
overkill. And if he did that every day (as you state he has the right to),
21 ads a week, 82 ads a month would be more posts than those looking for
help! Add to that, what if the few remaining dealers did the same?
Furthermore, I believe Ben could at the the very least TRY to appease the
complainers instead of "flipping the bird" back at them. He may even
increase his business that way!

The MC1377 is a bit tricky - i once built a similar circuit (however for
PAL, not NTSC). Moderately easy to get it working, but difficult to get
decent picture quality - it probably requires a double-sided, etched PCB and
good layout practices.

Furthermore, I miss the luma trap LC filter, and the delay line between pins
6-8 is also missing - better look at the MC1377 data sheet for an example
how to do it right.

Using some more modern chip, like the AD725 from Analog Devices, with
integrated tuned filters and digital delay line will probably provide better
results - the sample schematic from the datasheet should work nearly 1:1
(change the input connector and leave out the buffering op amps for the
pass-through option).

I never built anything with the AD725, but if someone wants to try, I can
offer a limited supply of samples (in SOIC-16), together with matching
MK2715 clock generator.

cu
Michael

Words of wisdom :-)

You can put anything you want in ROM chips.

I have read about a project to flash a Linux kernel into a x86's bios chip.

So is x86 designed to run MS Windows?
Certainly not, as 68K, x86 is a general purpose CPU.

The Atari ST happened to have a OS in its ROM that was written for
x86 in the first place. We have ran x86 software in our precious ataris
for almost 20 years now. ;-)

x86 assembly is nowadays executed by a microcode in the CPU's
Put another microcode (aranym) on top of it and you turn a modern fast
computer into a atari. Or a atari compatible if you wish.

In the early 70's I already worked on a mainframe that could run 2 different
platforms by microcode at the same time. Nobody complained that they
were not genuine.
Quite the opposite, it was generally considered a giant leap forward in
computer technological achievement.

This is true for aranym as well.

All this 'real atari' talk is conservatism that doesnt contribute anything
usefull. Its basically people growing old and remembering the toys of their
youth, forgetting all the harshness and limitations of that time.

That co-operative multitasking was a hack, unstable and slow to the point of
annoyance. I doubt that you have used AmigaOS 3.x at all in fact, or you
would know that AmigaOS was far more elegant and stable then Mac OS 7.1.

> As it is, I happen to find single-tasking TOS more useful than Workbench

So the moral to this story is....
If you need a computer for mission critical functions, hire a consulting team and get out of the way!
If they mess it up, fire'um and try someone new ;)
Don't wanna buy the bloat?
Then stop trying to replace all your people with computers....then everyone and their brother will not be edging into the markets trying to make some sort of a living on asthetics and nifty factors.

If you just want something to play with and learn on, does it really matter?
If your choice fits your wants and needs....who really cares?

I've enjoyed Atari lore and products most of my life, and will continue to do so, but lets face it. It's just a BRAND, a symbol, a marketing tool. It's not a nation. The minds and hearts behind Atari have moved on, and I doubt many of the lost much sleep over the gradual desentigration of the Fuji brand. So why should we?

I guess I'm just one of those insane people who doesn't care if Pepsi and Coke are in the same fridge. Gasp, I've even owned a GM, Ford, Crysler, and Toyota all at the same time! Have I no loyalties? *last time I checked, all the companies had great people working for them, some of them living in my own neighborhood*.

If there's gonna be a civil war....
At least find something worth fighting for, and fighting about.

Brian

Odd,

You may not have said anything about Americans, but Steve Sweet did.

I agree, the opposition to the excessive sig is not at all why I jumped into the thread.
I happen to agree that public forums have rules that should be respected if one wishes to be truly welcome.

I only jumped in because one or two bloaks keep bringing nationality into every thread, as if every American is a moron, and the UK and Europe never produced anything but perfect people.

Some of these same people have been known to use lude language, and name call like children over the silliest things. Then turn right around and throw kindergarden tantrums over how people sign letters.

This attitude to me is far more annoying than an obnoxious newsgroup sig.

I see the objective very clearly. A number of people would appreciate Carey altering an annoying behavior. Urging him to to change this is appropriate enough. What Americans, bombs, free speech, and liberation have to do with it is beyond me. It's also down right offensive!

Thank goodness I do not bias all citizens of the UK based on the bad conduct of one or two British people. And for the sake of the UK, and all EU nations, lets hope these isolationist socalist psychopaths don't get their way! Put them in charge, and you'll all be right back where you were pre world war I. Picking fights over NOTHING, while over half your people starve and a few live like pigs in 200 year old castles. That's the Europe MY grand parents barely escaped from with the tiniest thread of life, and hope.

Sorry gang...
I'm way off topic, but this Steve Sweet guy just touched a very bad nerve with me.
He's so far out of line, and so far from the truth.

Brian

This is possible, but partitioning is enough. There is no need in
formatting drives that do not have bad sectors, it's just a waste of time.

> Anytime a company gets too big they are arrogant due to little or no
> competition and have no interest in doing their best except at making
> bucks and the end user has to pick up their slack at his cost (whether
> it's in time or money)!

Is it really arrogance as much as it is red tape?
As a company grows, it takes on an ageing, ever increasingly expensive workforce, and a hungry set of investors. Their own people blow whistles every day, and fight the good fight to close nasty holes to insure the survival of their job. The idea that there is no competition for a big company is short on scruples. Department X is competing for the funds of department Y with all the vigor they can drum up. Programmer A wants that big promotion and title just as much as programmer B.

Torts, as Steve Sweet has pointed out rather elequently, are about pretense, and careful deliberation of "What A Reasonable Person Would Do".

If it is proven that MS intentionally left secruity holes with no intention of finding and closing them, then it is likely they'll loose the case. It's not reasonable to claim you have bullet proof glass if you KNOW about a specific weak spot where bullets pierce, do nothing about this weak spot, and do not disclose it.

It is reasonable to say, "We have a bullet proof glass that will make you safer, and these are some situations we KNOW it can't stop a bullet." If you discover any other weakness, please let us know ASAP so we can notify the people and attempt to fix our product." Any new weaknesses are promptly added to the product specs! How fast it gets fixed, if at all, is an entirely different issue; however, 'reasonable action' has been taken by disclosing said weaknesses as soon as they are discovered.

Many network attacks find weaknesses no one knew existed. As soon as they are found, notices go out like ticky tape on New Years Eve explaining what went wrong and how to protect yourself.

Everyone that deals with software has forseen these kinds of suits, and taken serious actions to behave in a manner that complies with torts and pretenses to date.

I personally do not recall MS, or any other software company claiming to have a bullet proof and secure product. What they have done, is promise a comittment to issues of security, and spent all kinds of resources, time, and money prooving it.

In the USA, there have been many cases over image advertising and branding techniques vs outright false advertising. The lines are pretty clear.
Obviously drinking a coke isn't going to make everyone smile, nor will wearing

that spiffy new perfume insure you get ravished by some beautiful blond in the office elevator. Branding, image, and impressing based marketing is quite legal depending on what time of the day your ad aires, and the nature of the product.

There is a sucker born every second, but let me assure you....the people who depend on software for a living, and truly suffer damages from software failures are NOT suckers. They read the fine print before they shell out the dough, and more oft than not, they carefully weigh all their options.

There's even more to torts, and the notion of what a reasonable person would do. If you open a shop, in a commercial district, with public exits and entrances in every nook and cranny, then invite the general public in to browse around....then you know you are suddenly at risk for theft. People will shop lift, break things, and open you up to a sleu of potential liabilities. Putting your BUISSNESS on the world wide web is a very close kin to opening a retail show-room floor. You know good and damn well that people are going to poke at these portals hoping to find some loot, or have a little fun vandalizing. You also know good and damn well that now and then, someone is gonna sneak in and give you problems. The very people that sell you the systems advise you of this, and they recommend that you have a back-up system ready to go online at the flip of a switch. They advise you to keep your sensitive data OFF the world wide web with a private intranet on privately leased lines. They hand you a list of precautions several hundred pages long, pertaining to encryption techniques, and back-up policies....so that if a theif does get in, the worst he can do is erase your data.

And the bottom line is this.
If software is money to you....and you are a reasonable person, then why on earth did you accept and SIGN the contract for these agreed services to go into buissness using our software, then turn around a sue when you didn't follow your side of the contract!

BTW, about the whole oil plug scenario....

1. Most states teach that one is to always do a walk around inspection of their vehicle before driving it. In theory at least, you have to learn how to do this to get a Driver's License. I know, most people don't do this once they get past the driver test, and some states don't have this inspection phase in the test; however, you HAVE been advised in places where this applies. So it's your ass, as the driver, if you drive off with an oiless engine!

2. Most car owner's manuals cleary state that if an owner is operating the vehicle in accordance to the way it was designed to be used, he will check the oil EVERY SINGLE TIME he intends to use it. Again, most people don't do this, but that doesn't change the fact it is in the manual as a precaution to keep you from burning up your engine.

How did these companies learn? By getting sued! Over and over again, and loosing. Read it, it's usually there. I think in this case with MS, the plantif just might not have a leg to stand on unless they have some real dirt that points to SERIOUS crimes of cover up and false advertising. They might get bought off if they're lucky....and that would most likely just be a calculated

dollar and cent buy off.

Brian

I don't think there's any bug in the OS that will make it bomb without
software causing it explicitly. Unless your ST is broken (bus errors can
be caused by hardware). In the few times I've used an Amiga, I've seen
more "Guru meditations" than I ever saw my ST bomb out.

> Amiga OS blows it clean out of the water, at least any version 2.x or up.

Even counting all Amiga fans I know, you're the first one who says
something positive about the suckly OS itself. :)

Except for Calamus there wasn't one program I couldn't replace with some equivalent on the Mac (don't mention Quark... too expensive). It took a while but I did it. The last one was POPwatch which I continued to use because there was nothing like it on the Mac side. I finally found it in a $20 shareware program called Mail Siphon which allows one to view their inbox, including headers and a configurable number of lines in the body, and delete spam or big attachments without downloading the entire e-mail. Then run your main mail program without fear of spam pouring in.

BTW, Outlook Express for Mac can be configured to partially retrieve e-mails based on their size, but its bottom limit is 5KB (go to Tools>Accounts and double-click the applicable provider then select Options). Mail Siphon gives you much more control, though, and unlike OE the partial e-mails aren't actually downloaded to your computer -- they're viewed on-screen with an option to save to a complete file.

http://www.maliasoft.com/us/mailsiphon.html

And please, no flames about this being an Atari newsgroup. There may be some programs or features on another platform that people don't know about but are accustomed to on the Atari side, making the transition more fluid.

Ask me what I replaced X-Boot or qed with ;-)

You literally had me spit out my drink all over myself when I read that.
The AmigaOS has always been far from elegant OR stable. Sorry, but you
Amigoids are simply fighting a losing battle by arguing the merits of
your OS. I happen to have an A1200 with AmigaOS 3.0 sitting on it's hard
drive, and I have to say that it makes MultiTOS look like an absolute
speed demon with more than one application open at once, let alone Mac
System 7.x. For added fun, bumping the color palette up to 256 colors
makes it downright unusable. BTW, you guys STILL don't have protected
memory, and at the rate of OS 4.0's development, it looks like you never
will. That's too bad, too, because that's the one thing that AmigaOS
needs the most. Aren't you guys tired of seeing guru meditation screens?

>>As it is, I happen to find single-tasking TOS more useful than Workbench

The OS should trap broken software, something TOS was hopeless at.

Unless your ST is broken (bus errors can
> be caused by hardware). In the few times I've used an Amiga, I've seen
> more "Guru meditations" than I ever saw my ST bomb out.

Meaning you only used AmigaOS 1.x, later versions did not have the "Guru
Meditations". 1.x was a little flakey, but given that it was breaking new
ground (unlike TOS) bringing a 32 bit multithreaded multitasking OS to home
users it was a real achievement... considering it took MS another 10 years
and Apple even longer.

Your comments are bordering on the stupid, as you well know. Still sour that you had a crap OS running on mediocre hardware... ah well, us Amigans (at the time) were well ahead of everyone else with our elegant, multitasking OS.

If your experiences are really that different, you are either telling porky's or had broken hardware.

You're really drifting into silly statements. If the software causes a bus error, an address error or anything like that, the OS cannot "trap" this any other way than to report this and kill the program. TOS does this with bombs.

> Meaning you only used AmigaOS 1.x, later versions did not have the "Guru

Hey hey, we were talking TOS 1.0 here. Don't start comparing it to later versions of other OSes.

hee hee..

> multithreaded multitasking OS to home
> users it was a real achievement...

Personally I cared more for the speed and the stability of TOS than a slow and crashing OS that has multithreading as an excuse for not working.

> You are full of it, do you really believe your own BS?.

Oh sure, just call me a liar.

Incidentally, what are you doing in an Atari newsgroup if you hate Ataris that much? You don't catch me subscribing to Amiga newsgroups just to shout about how crappy they are.

Maurits.

People who like Amigas generally can be found in amusement arcades
watching the flashing lights and pretty colours :)

Seriously, I know Clockmeister is trolling, but how can anyone argue
that AmigaOS is more stable than TOS? An ST with 1Mb RAM can run Cubase
reliably. What can you do with an Amiga with 1Mb RAM, other than play
games or do simple word processing?

Thanks Guys, I have had success with a Zip100 SCSi drive and a Sony 4x cdrom. I have tried 2 Quantum 2.1 gigs and a IBM 2.1, with no success. The drives are not even detected by Hddriver 7.6. I noticed that the internal termination resistor packs had been removed from the TT Mainboard. A long shot, I know. Especially as both a Zip and Cdrom work fine.
I suppose I could get a chicken, and spread it's blood around the yard, chanting..... ah SCSI:-)

true but the point was regarding a large company that's, at the very
least, close to having a monopoly. Lack of competition on a level playing
field is never good for the consumer. Why should ms care if there are
holes in it's programs or not? Bottom line is to make investors happy and
the consumer has little choice in the matter.

>dollar and cent buy off.
>

all well and good but does that also apply to the Pinto? After the
lawsuit loss, Ford never recalled the car to fix the bolt that caused a gas
tank explosion. It just paid the pre and post lawsuit death insurance
claims! So much for "learning"! Bottom line is money! Whichever way a
company can save it then it will so I'll never believe that one as large
as ms that's so intrenched in it's market and with minimal competition
would do otherwise.
Even if the claims are lost against ms it could wake it a bit and
that's not bad. I do fear for small companies (it would be devastating)

Hi,

I posted something in German a while ago here
http://atari-home.de/forum/index.php?board=3;action=display;threadid=906;start=0
I talked to Uwe Schneider (the developer) about the problem of not
recognizing 128MB modules. Besides the symetrical issue there is a
problem with the coding of the SIMM sizes.
There are 2 different ways 128MB was coded at the time.
MagnumTT uses:
128MB PD0 and PD1 open.
Many SIMMS use PD0=0 PD1=1.
Just remove the PD1 0 Ohm resistor and it should work. It did for me.

About Niels Trettin, Niels Reimann, AtariGroup, trettintrade or
whatever his name might be right now:
Some people have good others have bad experiences with him.
He is a professional ebay-trader. So do not be surprised if you sell
something to AtariGroup for $5 and find it at ebay for $50 later
offered by trettin-trade.

Joe

For someone who knows nothing about html I suggest:

Get an old simple version of HPP (I think you can still download older versions from the link) and put in some text and an image. Save and exit HPP.

Open the HPP output html file in a text editor and you will soon understand how a basic homepage can be setup in html.

Have CAB setup with Olga and use Everest or QED as editor.

Copy, paste and edit the html in the editor to your needs and watch how it works in CAB.

With this simple method anyone can go from zero knowledge to a simple but working homepage in less than two hours or so...

You're wasting your time with those two, they have their opinion (however
dumb), and you won't change them. Atari ST and spectrum owners are the same,
they point blank refuse to acknowledge they bought a technically inferiour
product. No matter what you say, they will come up with a "fact" we know not
to be true, but they want and need to believe to make their machine look
better than it is. So what if they like TOS better, let 'em suffer with it I
say...

You mean, there's an argument that a Spectrum is better than an Amiga?
Well, I suppose it's possible...

All of these machines are inferior to a nice Archimedes system, anyway.
Though I maintain that the Falcon was twice the computer the A1200 ever
was.

Are extremely helpful ;)

Just saying a quick thanks to one of those Americans who is helping me
with bits for my Falcon HD - it's just acquired a 68882, as well, so
hopefully it'll be a fully featured beast real soon now.

Of course, Americans not being able to see beyond their own borders, the
items will probably fall off the edge of the world ;)

I agree the Falcon is a good computer, but not twice the computer, twice the
price maybe... If the Falcon sold for A1200 prices, then yes the Falcon
would have the edge, but how many falcon's were sold? hmm...

Are you suggesting that the Archimedes isn't better than Atari and
Amiga? It's more stable, faster, more expandable, and offers
considerably better multi-tasking than the Amiga (or ST/Falcon models),
with the benefits of a ROM-based OS. Unlike the ST or Amiga, you can
still buy a direct, modern(ish) mass-produced(ish) descendant of the
Archimedes - the Iyonix - which offers XScale, PCI and Podules, at
merely the same price as, oh, a Mac G5 1.6GHz. RiscOS is vastly superior
to Workbench/AmigaOS or TOS.

>I agree the Falcon is a good computer, but not twice the computer, twice the

The Falcon did sell for A1200 prices when new. I remember my CDTV being
ï¿½399, and the A1200 being the same price when I took the CDTV back to
Dixons because of the missing mouse. At the same time the Falcon was
ï¿½399, but wasn't offered in places like Dixons, and had different RAM to
the Amiga - the Amiga came with an HD at that price, the Falcon had more
RAM (and DSP, and SCSI, and DSP) but no HD - the HD took it to ï¿½499/599
and extra RAM made the most expensive Falcon ï¿½699 IIRC... My A1200
system cost me nearly a grand with the overpriced Commodore multisync
(needed to use games /and/ serious Apps - wish I still had that monitor
now for my PS2 Linux box). Compared to the ï¿½3,000 my Mac IIx cost me, it
was a cheap computer, but I got bored of it in a year, despite being
someone who liked demos (and really like the A1200 demos).

Well I have have 2 Silica catalogues here, one for the Amiga and one for
Atari/PC/Consoles both from December 1993. A Falcon without HDD and 1MB RAM
was £399 with no software, discounted from £499. The base A1200 (No HDD 2MB
RAM) £299 (plus two games and another software pack). Compare a 4mb/209MB
HDD Falcon (£899) and a A1200 with 2MB/209MB HDD (£649). £250 for 2MB of
RAM!? Ok let's be fair, you have to include the DSP and 16MHz 030 CPU. The
Falcon was only competive against the A4000, which sold for silly money...
Even so, a 2mb 80MB HDD A4000 with 25MHz 030 was £899... The A4000 and
Falcon hold their value well over the years though! btw, I have the Falcon
page scanned if anyone wants it.

It's not our fault. Blame american media and government for that. Of course most Americans have trouble with this concept of educating themselves ;-) Besides. I see well beyond my borders. Maybe you're not talking to the right Americans?

Mark ;-)

Not at all. Also, there is a considerable difference between "techincally
inferior" and poorly engineered. Ataris represent very sensible design
tradeoffs for the time.

Power without the price wasn't just an advertising slogan.

No, twits like you simply need to get over yourselves and realize that
people like us would still not have bought Amigas even if we had an
infinite amount of someone else's money to waste.

Message-ID: <40154681$0$16737$cc9e4d1f@news.dial.pipex.com>
Source record: 21164

Hi all,

My cps-games domain comes to a close shortly. For those who brought Atari items from the online store and wish to keep updated please update your bookmarks to www.cps-electronics.co.uk . I dont keep addresses for long so I can't e-mail everyone. A few pages have been removed but most are still online for the cps-games domain for the moment.

Thanks to everyone who brought hardware and such from the site over this last year. I hope to bring outmore products very soon under the new domain name.

Cheers,
Chris

>All though hard drive capacity can be as high as you
>wish. Although I would imagine a 5 to 12 GB SCSI
>would work nicely inside the TT030.

But under TOS he is limited to drives A: to P: - i.e. maximum of
14 hard drive partitions. With 512 MB max, that will only permit
full use of a 7 GB drive - though of course it won't matter much
to waste anything above this on larger drives. If he wants to use
the extra capacity, he will need MagiC (?or MiNT?) as an
OS/extension, and perhaps an appropriate file selector if he uses
anything above P:.

Regards, /Peter/

Oklahoma? Sheesh ;-) It's a great place if you want to be completely
bored and left alone with no broadband internet connection. Not my choice
of life ;-) Actually if you stay near a metropolitan area you'd probably
be fine for broadband. Pretty much that's the most important thing to me
when choosing a place to live ;-)

Thanks,
Mark

The ST was designed in a amazingly short amount of time, and I agree they made a nice computer considering the timescale involved.

> No, twits like you simply need to get over yourselves and realize that

Oh that bitter are we? I'm open minded enough to want to own and use both machines. I may think the machine is technically inferior, but it doesn't stop me from liking or using the ST. I'm sure you would rather use your sugar daddy's money on something useful like a 286 PC then...

Have a look at BIGDOS - large partitions with TOS. No need for MagiC or
MiNT (if you don't want multitasking).

Not at all. I've just never been very tolerant of assholes. You can
search archives of this group from 1988 if you would like to verify
that.

> machines. I may think the machine is technically inferior, but it doesn't

Any 32bit machine sold at a reasonable price with a flat memory model is fine.

That elimianates most Amigas and Macs.

That also eliminates PC's until about 1993.

Hi folks

I've a large collection of ST Review, ST User, ST Format and Atari World mags and coverdisks - including some subscription-only disks - and I'd like them to go to a new home. What's more I want to give them away!

Yup, completely gratis and for free. The only catch is that you have to collect them from my southwest London home. I'm between Wimbledon and Kingston-upon-Thames, just off the A3 London to Portsmouth road and twenty minutes from junction ten of the M25.

Disk boxes will be included in the deal. I've also a load of Atari games, many boxed with manuals, I'd like to see the back of too.

Give me a shout if you're interested?

Cheers
Al

Or....Use HDDriver. One can change the partition order to some degree. Have the partitions you aren't using at the moment assigned last....that way if you run out of device letters...the one you need should still be handy.

Another thing that worked for me (as said above):
A really large ext2 partition or two to eat up the excess of the drive past 10 or so 1gig BGM partitions. It needs MiNT of course....but well worth it, even if all ya use it for is shadows and backups.

Brian

Very strange. Using the selling of my beautiful, well cared for, 2001 Cadillac DHS for sale ($55,000) ad in reference to anti spam, anti Microsoft comments. I've never been anti Microsoft. I think Bill Gates is as close to being a Saint as any CEO can get. Providing employment for literally thousands of people, being the at the top of the list as the most generous giver to charities. He's what German/Italians are made of, Saintly, Generous Geniuses.

BTW, Spam is associated with e-mail, not news groups.

Donald, The Magnificent!

Why not format a HD, I've never had problems with doing that, its generally unnecessary but saves possible problems if you take the drive from one platform to another.

Modestly. You have to reroute the ports not on the rear. The
cartridge port would require two small etched cards as well as a cable
and the analog joysticks on the left of the case would need two 15 pin
cables. The power supply interface is seven wires (plus shorting the
PS On line -- by the way, make sure you get a power supply with a
physical on/off switch as many don't have one!). The toughest part
would be the keyboard/mouse/joystick port, although a Eiffel would
solve that problem.

To summarize, it wouldn't be trivial, but it's not an impossible task
either.

Wow! I downloaded the demo from TransAction's website link to ASH. Is there no firm this side of the Atlantic who sell Atari software anymore?

I noticed on TransAction's website Jinnee is listed up to v2.5, which I guess is really cool, cause I'm certainly impressed by the demo of v1.02 that I have.

Thanks

Hmmm, more to worry about then. My stock Falcon (with a 44.1KHz clock
added) plays the few test MP3s I have here at 90-120%. My CT60 needs
50-70%. My son's 600Mhz G3 uses about 12% for the same file. Do you
have a sample MP3 file I could download for comparison tests?

>> finished :-)
> OK, got the answer myself now... It took 27.5 hours and the file was in
> fact 541.5 MB long.

As I remember it, the difference between fast and best compression is
marginal in terms of speed (though on a much, MUCH smaller file size).

I always made sure I used the maximum RAM setting (even though this is bound
to affect multitasking) and set the temp file to a partition with the most
free space. This makes sense with /normal/ sizes of file and 30Mb of free
RAM, but with a file like that, you can only pray B^)

I see it didn't come out right. Maybe you could try again with the settings
I suggested (and look at the doc file - there may be something more in there
that helps that I've forgotten right now).

HPP will take you through the start up steps, so you can see what's going on, but hand-coding works rather well once you get the hand of it. For example, if you want some text and a photo, your page would be:

Here is my sample page and here's a photo.

Of course, you can get much fancier, but I only know a couple dozen HTML commands and I get quite useful pages. A very useful resource is the Barebones Guide to HTML, which can be found at http://werbach.com/barebones/. Should you want to look at some sample pages, the ones I've written for my students are designed to be as minimal as possible. See http://lac.mtsac.edu/k and once you open the page choose "view source", which is often in the "View" menu, depending on your browser. I don't make any claims that my coding is great, but I do test my pages on several browsers.

Left hand side, next to the cart and midi ports. There are 2 analogue
joystick ports. Try the front most socket. Same as the STE;-)

I have been unable to get any of my 2.1 gig drives working. Internaly or externally. These are 2x Quantum Fireballs (TM and SE I think) and 1x IBM UW drive. I have set all to ID 0 and tried with or without termination.

I did get a zip drive and a 4x CDRom working happily. But apart from the old 200 meg drive no luck.

I did note that the termination resistor pack had been removed from the Mainboard. Any idea's? I will try a 500meg drive tonight to see if there is any difference.

Also, does anybody have an e-mail address for this gentleman selling TTram boards?

Thanks again

Mark Bedingfield

Which problems are you refering to, which cannot be resolved just by
partitioning? Partitioning wipes old any old filesystem type and layout
data and overwrites it with the data required for the Atari. There is no
need for anything else to be done in order to achieve TOS-compatibility.

Might be worth your while running the SCSI driver from the CBHD package and
trying it again, I found variable results with my scanner (E3) with various
flavours of HDDriver.

And of course you've selected the right scanner in the config dialog?

it's not low-priority. It's the final goal. But in order to get there
the ARAnyM itself needs to be improved a bit, I think.

> I think that it would help promote Aranym's cause greatly if that target

That's one of the goals, right.

> If the machine boots without ever having to see, understand
> or maintain anything about the OS that is bootstrapping the
> TOS OS then I might be converted.

The current ARAnyM/AFROS Live CD does not hide the underlying Linux kernel perfectly yet but I believe that it's just a matter of few tweaks to get it hidden so well that you wouldn't even notice it. Give it a try and be tolerant to the questions about your mouse and resolution - some things are not easy to detect automatically.

> And I hate X86...

I used to hate that architecture as well. But later I found out that AMD was actually doing great CPUs that happened to be compatible with the old x86 instructions in order to run all existing x86 software - but internally these Athlon CPUs are completely different than the stuff Intel produces. Thus I changed my mind and now I favour AMD over Intel. I don't like Intel, I don't like the old x86 architecture, I hate their assembler - but I do like the chips the AMD produces and I like to have AMD powered ARAnyM.

As you can see, even with ARAnyM I am still in the "Intel Outside" camp :)

> My CT60 with the old DSP has better results with MP3 than Aranym PC ;-)

Excuse me but this is a very inaccurate statement. While CT60 is more or less the same (60-120 MHz), "ARAnyM PC" is completely unknown thing unless you define the speed of the host PC.

In other words: I can prove that my ARAnyM running on K7@2300 can beat your CT60 in everything. At the same time, I am sure that my other ARAnyM running on K5@75 is slower than stock Falcon.

Can you see the difference?

you actually don't need windows or linux. You can adapt EmuTOS or FreeMiNT to boot on any hardware directly. It would only take hudred thousands of manhours to do that. Do you have the manpower handy? Working for free?

Do you guys understand the problems we had to decide how to solve them best when we were designing the ARAnyM? I don't think so.

> And even if u hate TOS, it is ESSENTIAL for booting aranym...

this is not true. AFROS does not use TOS and boots. Also, FreeMiNT can be extended to boot directly but noone seems to be interested in that.

> But tell me this: what new Aranym brings to scene, apart from speed?

> which uses NEW resources Aranym (not) have, so we can have something new
> and revolutionary?

Well. I don't want programmers to create applications that would run on ARAnyM only (as you call it 'revolutional'). This would not help anyone. There are few remaining software authors left and the only way of keeping the whole atari scene alive is to produce 100% compatible software running on most reasonable configurations (ranging probably from stock Falcon up to the 060 based machines).

> Does NeoN use
> any of 3d gfx power on Aranym? Does Cubase use resources of modern PC
> Sound cards?

I could say "not yet" but judging from the discussion going on here I think I can safely say "it never will". There doesn't seem to be any interest from the regular users and without that nothing will happen.

> resources exist? Can u tell me one thing Aranym can do and Falcon can
> not? (mind u, Falcon CAN play AVi, divx etc, just very slow)

this is actually a funny point. You can watch movie on Falcon and you don't mind that 2 hours movie will take 15 hours to watch :-)

> I can name
> u a LOT of Falcon apps which can NOT run on aranym. I can name u also a
> LOT of apps which runs on ST/TT and Falcon (so u cant blame Falcon
> specifics) which dont run on aranym, and so on...

This is also funny - you measure the power of a particular machine by counting the applications that are specific for this machine. So Falcon has about 800 specific applications, compared to ARAnyM, which doesn't have any app that would be ARAnyM only (since ARAnyM runs all clean software) - the result is that Falcon is the king while ARAnyM is the loser.

Frankly, I never thought like that. Maybe I should design a special application that would run on ARAnyM only. Hmm. Maybe we could hire some demo group? :-) LOL

you are making it even more confusing than it was :)

> And now comes the funny part... Aranym is present on Debian m68k so in
> fact you could perhaps run Aranym on real Atari hardware as well!

sure. The source code is even partially prepared for running on m68k based machines at full speed of the host CPU (similar to VMware). But there is noone working on finishing it. Maybe you could join the team and make ARAnyM running on your TT030 at full speed for the NAS?

> Aranym is available via APT (Advanced Packaging Tool) in m68k and it

Excuse me but this is a complete BS. You never paid us a dime but you downloaded and tried aranym. If it wasn't free ("free-as-beer") you wouldn't able to do that.

Besides, ARAnyM and the complete AFROS are way more free that you could ever imagine ("free as in freedom") but I am not going to bother you with that 'philosophy'.

yes some DMA in some STE have a bad FIFO that lost 2 bytes among the 32
bytes !

Your chip is surely a C025913 no ???
The C398739 is an other part that is exactly the same as C025913 (in
ST/STF/MST).

I have several C025913 that are good...(only some 25913 are bugged !). I can
send you one + the socket (better to change it if it is bad too).

I designed the pages so blame me. I am a poor web designer and I don't run any exciting "Atari" applications so I didn't know how to present the ARAnyM best. Feel free to contribute better screenshots. Or follow the link to Standa's pages - you'll see there Calamus and more.

> :))

This is it. Everyone should reread that paragraph. All "hardcore Atarians" are actually ready to switch the platform. Isn't this ironic...

Now compare this with the few lunatics that are trying to keep the platform alive by developing either hardware (ACP?) or software solutions for letting the applications run even after the last original atari halts. I think these guys are likely to fail since the community support is far from what was expected.

BTW, this year we are going to 'celebrate' 10 years since last original Atari 32bit computer was sold, I am afraid.

Petr

hum each of us has or search a style of life...
Mine may be in the style of Oklahoma... I mean I prefer a poor 56K phone
internet connection and living in a great place like montain or forest.
This time, I'm at 3 kms of a city, so I use a 512Kbit line for internet, but
if I have to loose this speed, I agree if I win a better place far ...far
from noisly cities...

So one day if you get no more news from me, you will know why ;-))

No, a proper OS gives you the option of killing or suspending the rogue
application whilst leaving the rest of the system intact. Had you ever
seriously used an Amiga you would understand how this works.

Perhaps you would also understand how my Amiga with OS2.0 operated for two
weeks without having to reboot after two applications which had crashed were
suspended by the OS.

Regardsless, 1.3 featured smooth multitasking and could run software at
various resolutions on different screens. If you don't think that is cool or
useful then you are a twit, seriously.

From your comments it is plainly obvious that you do not know much about
modern operating systems and how they work which also explains why TOS would

be so appealing to you.

> Incidentally, what are you doing in an Atari newsgroup if you hate
> Ataris that much? You don't catch me subscribing to Amiga newsgroups

I don't hate Atari's, on the contrary, but I do know how to spot illinformed
bullshit when I see it as I have owned and used both systems.

Konrad reported to me soon after the 0.8.5beta release that this was the worst windows version ever and that he went back to 0.8.2 or even 0.8.0. So it is quite possible that your future is actually bright - the only thing we need is a developer testing and fixing the future windows versions of ARAnyM.

In this free world of OpenSource it's all based on interest. Interest generates results. It's all sort of DYI but not really since the results are shared. But if there are no windows developers so far it's not as good as it is on Linux.

Petr

P.S. Wondering if coLinux is helpful for ARAnyM on Windows or not :)

Run a MIDI sequencer reliably. On an Amiga you'd need an additional
interface, and it still wouldn't be as good as Cubase.

confirming that. I don't need heating in my small computer room, the hungry CPU powered by 300W PSU produces enough heat :-)

However it's good to notice that both latest FreeMiNT and EmuTOS support "CPU idle calls" which saves power considerably. The temperature of the CPU goes 10 Celsius degrees down when the FreeMiNT is not doing anything.

I think he was refering to that you must first own hardware capable of
running linux. Not questioning whether or not the distribution of
related host OS, emulating layer, the Atari OS FreeMiNT, etc are free
or not.

IMO a very valid point.

You misquoted and misreplied. I don't care about percents and wasn't
arguing if something takes 7 or 77%. I just wanted to correct Didier in
his "CT60 is faster than ARAnyM" statement which was simply incorrect
without adding more info about his PC speed.

>> In other words: I can prove that my ARAnyM running on K7@2300 can beat

> No I cant. U can beat CT60 in everything as long its pure CPU

you misread again. I have been still trying to explain that speed of
ARAnyM depends on speed of the host so without telling the host speed you
can't really compare ARAnyM with other hardware.

That's the difference I was referring to: difference between two ARAnyM
machines where one is faster than CT60 while the other is slower than
stock Falcon.

Do you get it now or am I wasting time because you don't want to
read what I write?

Excuse me, this is also inacurate. With DSP on MP3 replay with aniplayer
take 7-9% CPU, less with Falcamp.

>

>
> Can you see the difference?

No I cant. U can beat CT60 in everything as long its pure CPU, pure GEM,
dont acces hardware, its not a game, a tracker and so on... in a word, IF
it happens to run on Aranym. I dont realy care if Aranym is faster in CPU
tasks, if there are tasks i regulary use and they dont work in Aranym at
all. And i do use those tasks... I dont like my Falcon and Ataris because
of GEM apps ONLY, i love the whole package...

Does that mean that Free software solution for any (and also the cheapest available) hardware is still not good enough for the remaining few Atari users?

Does it mean that we were expected to actually GIVE AWAY new Athlon powered machines with preinstalled ARAnyM/AFROS for _FREE_?

Are you guys serious or are you living on another planet?

Maybe we should start selling the ARAnyM right now, say for $400 (that would actually be underpriced, but we must have a competitive price to sell large amounts, right?). Maybe it would be accepted better then. And I must not forget to create the killer ARAnyM-only application :)

With respect to the original post.

I've got an early series STe which had one of these bugged DMA chips.
It has also got the early bugged 1.6 TOS (oh joy!). I had the DMA
replaced, thanks to Best Electronics many years ago.

I can assure you that the bugged DMA does NOT discriminate between
officially badged Atari hard drives, and their third party
counterparts! ;-) It corrupts both equally! The drive in question was
an early series Atari 'SH' model.

Source record: 21130

Some people reported problems with Quantum Fireballs, not in being recognized, but in having id negotiation that could not be disabled. They were recognized, but you could not boot from them, because they did not have a static address. Do not know what model numbers were involved.

Nobody has reported problems with an IBM drive.

You really need to have data sheets on your drives. They can be found by drive part number on the www. They will tell you where other relevant jumpers might be, such as parity, which could be the problem here.

One of the jumpers usually is for powering internal termination, which is probably why your TT does not have the resistor packs. It didn't need them.

Will send the requested e-mail address if I have it in the next few minutes. Got my memory sticks from networks@networks.com, and when I got mine, they had more.

You may have seen the posting that pointed out Neils Trettin is in it for the money, and buys and sells under several names. What he sells seems to be OK, but the memory sticks that go into it can be problems. Those data sheets are also on the www, to help you resolve problems, and some number on the memory stick will get you to it.

Last I looked, people were still selling VME Ethernet boards, but at the prices they originally sold for, which matches the prices the machines sold for. A TT originally sold for close to $1000 USD, and the TTM195 monitor for another $1000, so spending $500 on an ethernet board, or e.g. $1000 on an OCR program, was not so out of the question.

My TT has a 2.1 gig seagate drive, and uses a 4.2 gig external drive under MiNT.

Jim

Mark Bedingfield <mark@computercom.com.au> writes:

: I have been unable to get any of my 2.1 gig drives working. Internaly or
: externally. These are 2x Quantum Fireballs (TM and SE I think) and 1x IBM UW
: drive. I have set all to ID 0 and tried with or without termination.

: I did get a zip drive and a 4x CDRom working happily. But apart from the
: old 200 meg drive no luck.

: I did note that the termination resistor pack had been removed from the
: Mainboard. Any idea's? I will try a 500meg drive tonight to see if there is
: any difference.

: Also, does anybody have an e-mail address for this gentleman selling
: TTram boards?

: Thanks again

: Mark Bedingfield

Most "guru meditations" do infact leave the rest of GEM intact.

[deletia]

Any sane OS is going to terminate an application that causes
a bus error. This simply isn't something that any sane person
can knock GEM for.

"real" operating systems KILL rogue processes with extreme prejudice.

Regardless of how much you might like to kid yourself, an Amiga remains
for all practical purposes just a rediculously overpriced ST.

Some of us had lives even then, and other things to spend money on.

Hi, Petr!

PS> Does that mean that [...]

Don't feel offended by the people.

There are just two extremely contrary parties (one of whom you belong to)
that probably never will find a consens about what to call Atari
(Hardware, Clones, Emulators, OSes, ...).

Keep in mind that ArAnyM is appreciated by many users and that your team's
striving for an open source "Atari OS" really did push and lead together
several formerly single projects.

You (your team) are doing a great job. People working on Atari hardware
are doing so also. It's a pity that some people in the Atari community
tend to offend each other instead of working hand in hand with each other.

Just my 2 cents

Alexander

Hi Pablo,

Does MegaSTE use same chip? I have MSTE mobo at parents place in non
working state... I could get the DMA chip out, but i cant guarantee its
100% working (MSTE was fried by lightning)

> Yes i get now, that u waste time. Stop waisting it and explaining us
> things we dont get, or misread, or simply understand english correctly. U
> stated your superiority, now leave us plabeians in peace...

I have tried to be as technical as possible in this sub-thread started by Didier. There wasn't any personal attack from me, no superiority or anything like that. I have just tried to explain that while most emulators of existing machines try to keep the speed of emulated environment same as the original machine, ARAnyM is different - it doesn't emulate any existing machine and so it can run as fast as possible :) Thus comparing CT60 with ARAnyM on "a PC" is like comparing apples and pears simply because the speed of pears is unknown ;-)

It's unfortunate that people from the 'other camp' are so allergic on the ARAnyM word that they don't follow even simplest technical explanations in plain english. I know it might be partially my fault since in the beginning I was so surprised that the ARAnyM project was not hailed like the Atari users lifesaver that I had some stronger discussions that perhaps polarized the 'scene'. But since then I (or rather we, as many people is involved in the project directly or indirectly) realized that users are not gonna switch to ARAnyM suddenly and that ARAnyM will likely coexist with other TOS compatible computers for years. So we keep explaining in the hope that people will realize some facts and help the TOS/GEM world survive (a bit longer).

You may not know that the ARAnyM and AFROS projects (the latter includes fruits of other well known open source projects like FreeMiNT, XaAES, fVDI, Teradesk and more) need interested and supporting users together with active developers, otherwise they'll fail. I think that all commercial software for TOS/GEM has ceased developing and distribution and disappeared. There are not enough paying customers. The platform is long time dead from commercial point of view. The last hope for remaining users is IMHO in supporting the development of open source OS and applications. You may disagree with me but I have been using Atari computers for last 16 years and I remember having hundreds of Atari friends just in our 100,000 city. Then there were tenths, then there were three guys and now I am alone with the Falcon in the whole city and I happen to know _personally_ everybody in 10,000,000 Czech Republic that is still using an Atari computer - simply because there might be only about 40 users left. If there isn't enough good new applications soon these 40 remaining users switch to another platform. Most of them do have a PC already, anyway, and are using it for this or that, accessing internet, and replaying some stuff, and doing school work, or writing documents etc.

I know it. Everybody knows it. Also most of you in the hardcore camp do have a PC or a Mac, get real, it's not a shame simply because the alien hardware can be turned into something familiar and useful (you know what I mean).

This is getting long so chances are nobody reads it up to this point but anyway: if we don't unite soon, don't start strongly supporting the remaining choices (FreeMiNT and the rest of AFROS, HighWire, Aniplayer, good desktop, <fill in the applications that are being slowly developed or were expected but abandoned>) and strongly support and encourage the remaining active developers then we are dead no matter how much you like your genuine Atari hardware made in China 10-20 years ago for a company that always did care about their game consoles only - and even those was supporting so badly that they failed (Jaguar). Yes, it's true, closing your eyes doesn't change that, only real activity can.

To get back to the original question ("should I sell falcon and buy a PC for ARAnyM") that started this long thread:

No, don't sell your Falcon. You can't sell it for any reasonable price, anyway, so keep it, it may be handy for some nostalgic demoing or gaming (I too play Willie's Adventures demo sometimes on my Falcon040 and have been asking the authors to release full versions regularly for last five years - BTW they refuse for some weird reason).

BUT! If you happen to get some real cheap PC hardware don't hesitate to buy it (say Athlon 2GHz for $299) and be assured that thanks to ARAnyM you'll be able to turn that box into FreeMiNT/GEM workstation that will run most software you are familiar with better than you expected and that will allow you to do more things easier than you were used to on the old Falcon.

And for creating MOD's using trackers, Paula was much more suited to
creating and playing back samples then that YM POS. There were more people
creating MOD's on their 1Mb Amigas then Atari users using their MIDI port,
I'm willing to bet.

> users?

It means that those who haven't yet got an appropriate machine to run
aranym needs to get one in order to benefit from this deal. That is
what I think Lp was suggesting.

> Does it mean that we were expected to actually GIVE AWAY new Athlon
> powered machines with preinstalled ARAnyM/AFROS for _FREE_?

What even gave you that idea?

> Are you guys serious or are you living on another planet?

Please read my reply one more time. I tried to clarify what I think Lp
meant, I don't think I deserve this kind of response.

Regards,

Joakim

> because the speed of pears is unknown ;-)

But the speed of pear is not unknown. On Aranym page it nicely say, AMD Athlon 1800+. Voila, fixed speed. And all we said is that 60-80% CPU speed is not accurate, since its actualy from 4-9%, depending on CT60 speed (60, 66, 72 or 100mhz + different bus speeds). Or CPU only values, which will differ as well. But u are right in one thing, pear speed is odd incase u use anything except Linux.. no JIT, probs on Macs etc, altough aranym said "on any machine" Those are some of probs, which actualy noone want to admit loudly... And using lowest possible values instead of highest, its little psychological rochade, to impress ppl. Now i guess the correct ratio in this case is> 9% on athlon 1800+ vs 5-7% on ct60 66mhz with DSP and 60-80% without DSP. If u want to correct us and educate us, please do it honestly.

And i repeat, i have NO problem with Aranym. I do have a prob with Aranym team to be honest. If we say that Aranym is not new Atari, or show ANY difference in opinion as Aranym team, this happens... Simply no room for any diference there.. After last burst of expresisons etc in MiNT list, i simply deleted Aranym from hdd... And on end, calling Aranym virtual machine, or just Aranym, and/or Milan GEM compatible instead new Atari is NOTHING bad! I dont mean they are inferior because of that name, its just a fact. Like pear is pear, and apple is apple. Teste decide which is better on end.

Hm, does that mean I can get a genuine Linux boot by just instructing
HDDriver to boot from the Linux partion?

On the other hand HDDriver sure is a TOS program, anyway...?

On the third hand (Shiva??) afaIk you can't set videomode for my et4000
from within Linux. So it's best to use bootstrap anyway.

>>Is Linux just an emulator running on top of TOS.

Cool... I don't think I'm up to the task but actually all this stupid
nonsens about what is an emulator or not makes it tempting to really get
Aranym working on genuine Atari hardware... :-)

>>Aranym is available via APT (Advanced Packaging Tool) in m68k and it

Debian Sarge m68k on the TT. I'm right now doing a dist-upgrade on it
that has been going on for more than 24 hours... First 150 MB data via
APT on nullmodem and since this morning it's truggling hard to unpack

and install. Right now "Unpacking replacement wenglish ...".

Petr is completely right.

Has there ever been hardware that was free? (please dont mention cellphones)

LP could as well blame all free atari software that you had
to buy a atari computer to run it.

BTW.

I spent a few hours on installing the afros on a laptop
and on a desktop.

I am very happy that I can go on writing for my favourate
platform, even when all my ataris crumble to dust.

No, no HDDriver is necessary. LILO boots directly from the boot sector of your HDD, just like on other (ia32) machines.

> afaIk you can't set videomode for my et4000
> from within Linux. So it's best to use bootstrap anyway.

I agree that bootstrap.ttp is better than LILO but I wanted to point out that LILO is actually available for Atari machines. I know it was a lot of work to develop it and it's a bit sad that nobody uses it.

> Think what would have happend if Atari made computers with Power-PC
> processor... :-) emulators all over the place...

very true. But since it would be made by Atari nobody would complain ;-)))

>>>I would really love to se Aranym running on my TT just for fun... Who

> That would be some sort of Falcon emulator where normal tasks would run
> at descent speed?

well, I hate to hear "Falcon emulator" when we talk about aranym but it's all my fault so I need to cope with that. Anyway, current aranym, if it worked on TT, would probably give you an emulation of VIDEL and DSP but I don't think you'd be able to actually run something using those chips at a decent speed. Access to all hardware registers would have to be emulated and so any program accessing them often (like e.g. operating system) would be slow as hell. This is a general problem of all virtual machines, BTW. That's why I suggest to buy a FAST host machine for ARAnyM :))

Hi

I have just uploaded to my homepage a short description
of how to install the afros on a Suse Linux/KDE box with
a minimum of fuz.

It is meant for people like me who recently acquired such
a system. I didnt want to buy Windows XP.

No commandline usage is needed.
So it is in the true atari GEM spirit. ;-)

I now have a nice and fast Atari notebook with colourfull XGA screen.
I think I'll bring it with me to the Dordrecht Atari Dag.

> > No, twits like you simply need to get over yourselves and realize that
> > people like us would still not have bought Amigas even if we had an
> > infinite amount of someone else's money to waste.

I didn't get an Amiga back when....because they cost a bloody fortune that I did not have at the time, and the only thing the campus Amiga heads were interested in were hacked games.

Instead, I got an ST with a Super Charger DOS box, and a Spectra GCR. Later traded all that in for a Falcon. My PC/Mac frends were envious as I was running 3 systems, faster than the real thing, for the price of one high end Amiga...minus any PC-DOS bridgeboard.

Now, I have an Amiga 2000 to go with my Ataris and PCs. Someone was using it for a door jam in his garage. It's pretty neat; althoe I'm having a booger of a time getting it to see a CD-ROM drive or read-write MS-DOS disks. The more I download from aminet, the more I realize an average user can't install any of this stuff and get it working. It's all poorly documented, assumes you know Amiga DOS inside and out, often doesn't work unless you have some specific version of ROMS, Workbench, etc...and repalce this thinggy with that thinggy and hack up a script or two.

I'm looking forward to learning....but so far it's taken a lot more time/money than I care to spend on it.

With my Atari machines...I had entire networks set up in the time I've spent just trying to connect a CD drive to this Amiga. I slapped together a 5 synth studio with synced tape decks and was producing music in less than 2 hours....but with the Amiga....I'm still trying to figure out how to tell software and the OS the difference between my Multiface ports and the built in ones.

The Amiga OS is so much more complex for the user...which I'm sure is a good thing in that in theory, it can do more. It's really hard to figure out, and things just aren't documented very well. Get a book? I did! Four of them, and they appear to be written by and for programming gurus. I'm learning....but slowly.

I've also noticed the Amiga has lots of stuff that just doesn't work. I.E. Set it for all these cool colors it's supposed to support, and the thing runs so slow it hurts. For a reasonably snappy work bench....things are about equilvilant to an ST. One app, 2 to 16 colors, and not much real estate area on the screen.

I'm having better luck with the Amiga Forever Emulator! Now that's been fun/cool....I just wish the sound was better.

> Athlon 1800+. Voila, fixed speed.

well. When I started working on ARAnyM I had a Duron @ 600. Now I have a Thunderbird (IIRC, simply an Athlon XP family) @ 2300 and I am looking for a cheap upgrade to Barton @ 3200 (still Athlon XP family, but running at 400 MHz bus speed). So there is no fixed speed at all. My personal ARAnyM increases speed every couple of months for a few bucks (I always sell the previous CPU to somebody else :-).

> is not accurate, since its actualy from 4-9%, depending on CT60

Aha, now I get you. Your point is that CT60 with Falcon's DSP can replay MP3 with lower CPU load than ARAnyM @ 1800. Well, this is quite possible! Yes, I don't have a problem with that. Simply because when it's 7% or 9% the difference is close to none - I remember when the MP3 replay load dropped under 30% the machine was normally usable and that's the key.

But I admit again that it's perfectly possible for CT60 with DSP to beat ARAnyM @ 1800 in MP3 replay. I hope you all are happier now :-)

> aranym said "on any machine" Those are some of probs, which actualy
> noone want to admit loudly...

Hehe. The ARAnyM is designed to run everywhere. But _I_ happen to use linux and so _I_ make it running on Linux (same for Standa and Milan, BTW). Other guys (like Francois and Stefan) with Mac make it running on Mac. It also happens to run on Cygwin for Windows, FreeBSD and perhaps on more systems, but there are no active hackers for these platforms, AFAIK.

BTW, you might be missing the point - this is not commercial software and it is not sold with a guarantee that it works on any machine - this is an open source project and volunteers making it running on other platforms than those the main developers use are very welcome. I repeat - it's easily possible to make it running on just about anything - but not if there is no interest and no developer.

Same message I tried to send for all the other open source projects out there - HighWire, TeraDesk, XaAES, FreeMiNT, [fo]VDI, EasyMiNT, SpareMiNT and god knows what else is being done for the remaining atarians for free - they all deserve your attention and interest and a helping

hand. Think about it.

> of highest, its little psychological rochade, to impress ppl.

Yes! I wanted to impress people and I wanted to show the ARAnyM in the best possible light. I want users to join it and you already know why. But the numbers aren't fake and I'd love to repeat tests with my current @2300. And most importantly - the benchmarks are just bunch of numbers. What's important is the portability, ease of HW upgrade, stability and generally more modern extensions and peripherals. Simple example: Atari (erm. GEM compatible desktop) hooked to internet via WiFi PCMCIA card...

> guess the correct ratio in this case is> 9% on athlon 1800+ vs 5-7% on
> ct60 66mhz with DSP and 60-80% without DSP. If u want to correct us and
> educate us, please do it honestly.

I love to repeat for third time that CT60 beats ARAnyM @1800 in MP3 replaying. And I congratulate to the author of the greatly optimized DSP routines (Didier? You rule man!) since it's his credit.
BTW, Didier also developed sound support for ARAnyM and we're grateful for that.

> I do have a prob with Aranym team to be honest.

that's perfectly OK. We are just another guys. BTW, the team is sometime inconsistent in the press releases and everyone of us talks for himself only - so feel free to name the one you have prob with, we are OK with that :)

> And on end, calling Aranym virtual machine, or just Aranym, and/or Milan
> GEM compatible instead new Atari is NOTHING bad!

Well, it's actually perfectly right to call ARAnyM a virtual machine. Have I ever said otherwise?

Ah, I just got it - you want us to remove the "Atari" word and call it a "GEM compatible machine". Well, you're damn right. The Atari is so long dead that using their name for a new virtual machine like ARAnyM is was actually a bad decision from the marking point of view.

Now we can start thinking about renaming the project, right? Atari Running on Any Machine is wrong - it's definitely not atari, and we can't fulfil the "any machine" without volunteers so we fail. How about GREMLIN? GEM running on LINux? (no, it's not a typo - GEMLIN would be a bit dry, gremlin sounds cooler to me :) LOL

I have limited space, limited budget. Already 3 complete systems in one room.
Plus an O2 not even setup. You really expect EVERYONE to run out and
buy more boxes with yet another OS they are not familiar with?

> Does it mean that we were expected to actually GIVE AWAY new Athlon
> powered machines with preinstalled ARAnyM/AFROS for _FREE_?

That's up to you.

> Are you guys serious or are you living on another planet?

I'd ask the same of you. The "any" in the name is mis-leading as it don't run
on anything but linux to where I'd deem it useable.

> Maybe we should start selling the ARAnyM right now, say for $400
> (that would actually be underpriced, but we must have a competitive price
> to sell large amounts, right?). Maybe it would be accepted better then.
> And I must not forget to create the killer ARAnyM-only application :)

I'm sure whatever killer app you came up with could be utilized on the host system
directly, like DVD playback. A killer app to me would be a real web browser.
If you got time for that, go ahead and amaze me.
I would focus more on bug squashing, and making it work on "any" system.
I have macosx and I will not buy a linux box to tinker with an emulator.
Hatari works, they must have a mac guru in that camp.

Actually this is not true, here is how dictionary.com describes spam:

"Unsolicited e-mail, often of a commercial nature, sent indiscriminately to
multiple mailing lists, individuals, or newsgroups; junk e-mail."

Here is the url, in case you would like to verify this:

http://dictionary.reference.com/search?q=spam

Just an FYI.

In the end, all this pointless bickering does is make this newsgroup look
bad as the size of the discussion thread
outweighs anything Atari-related... and that's a shame.

I'd be glad if all problem reports were directed to the aranym-user
mailing lists. I really don't follow this newsgroup (unless I am told to
look at an interesting thread :) so you might as well stay here without an
answer.

To the subject: ARAnyM on the Live CD is set to boot in fullscreen. The
DSL setup asks for X-Windows resolution during boot, though. Try to set it
to 800x600 since I set the fVDI to 800x600 as well. At least I think so.
Also it seems to depend on the X server - the framebuffer one behaves
differently than the VESA. And another thing - EmuTOS boots in 640x480 and
it doesn't switch the X server to fullscreen for the small time period.
Well, these are all limitations of the general X servers included on the
LiveCD - I can assure you that on my finetuned setup with a nVIDIA card
ARAnyM runs in fullscreen from 640x400 up to 1280x1024.

So for this live CD beta version: select the VESA X-server, choose
800x600 resolution, close your eyes for the 8 seconds of EmuTOS booting
and as soon as fVDI is activated you should have the desktop in fullscreen.

> Plus an O2 not even setup. You really expect EVERYONE to run out and
> buy more boxes with yet another OS they are not familiar with?

No. That wasn't the goal. Current beta versions of ARAnyM are best for those that already have a non-Atari machine handy. I don't want anyone to go buying more boxes, sure not. What I say is:

- if your atari computer dies, and you can't get a replacement, ARAnyM can get data from your harddrive and even allow you continue using it like you were used to on the real Atari.

- if your atari computer is not fast enough, you're missing RAM, resolution, harddisk space, network connection or anything else and you simply decided to buy a PC because you can't get an Atari like computer - then there is ARAnyM for you that can save you from the windows hell.

This is what I say about current ARAnyM.

And if ARAnyM was ever finished then I could say "OK, go to any shop, buy any hardware, get this CD and it will install AFROS on it so you'll boot to your familiar desktop". You know this is the final goal but you still complain.

>> Does it mean that we were expected to actually GIVE AWAY new Athlon
>> powered machines with preinstalled ARAnyM/AFROS for _FREE_?
>
> That's up to you.

I started collecting money already, don't worry.

>> Are you guys serious or are you living on another planet?
>
> I'd ask the same of you. The "any" in the name is mis-leading as it
> don't run on anything but linux to where I'd deem it useable.

I can just ask you to re-read my other post about this very topic. I think the subject is "the real situation".

I really enjoy your complaints - it sounds like I owe you something. Like I sold you ARAnyM, you paid scary money, then unpacked it at home and found out it didn't work on your *any* machine. Luckily I explain this in the other post ("the real situation") as well. Please do me a favor and don't reply here, I'd hate to repeat myself again.

> host system directly, like DVD playback. A killer app to me would be a
> real web browser. If you got time for that, go ahead and amaze me.

We are just a small part of the whole machine that produces
"atari" software for free. If we develop ARAnyM we do that to allow others
develop more applications using the ARAnyM. You know it. I told it so many
times. So I believe our work on ARAnyM actually helps bringing you a real
web browser, even if the help is indirect.

> I would focus more on bug squashing, and making it work on "any" system.

I am glad you volunteer.

> I have macosx and I will not buy a linux box to tinker with an emulator.

I remember your arguments from MiNT list and from here last time we
discussed it. I apologized to you several times already. I really don't
want you to buy a linux box, I swear! :)

> Hatari works, they must have a mac guru in that camp.

And? Should I hire him?

Oh well. How long will it take you to understand the situation.

Ahhh, now I remember. The IBM drives I remember a few years ago having
similar problems. This was on a server trying to use an Adaptec RAID card.
Because the ID's kept changing, well you could imagine. All of these drives
work OK on the Falcon. Of course they are not boot drives in that instance.

>

Got em;-), all avaliable using Google. All very basic one of the Quantums
only has ID0,1,2 and TE. Could not be easier.

The whole unit coust me $190. I had a ECL monitor donated to me last year.
Not bad I think.

Indeed not, and I actually think that was the point here really.

I can understand this, since I have had the same thought myself, that
the system does have costs, even if the software is completely free.

Not trying to start a war here, just adding my 2 cents.

A couple of months ago I sent a couple of Mb of freely distributable
games to another person with a monochrome monitor. If you have a
computer (not necessarily an Atari) with both a hard drive and an
Internet connection email me privately. I believe I still have the
files easily at hand.

As to commercial games, a few do work in monochrome, but most will
not.

I never saw the "Guru" ask me to suspend an application that caused a
processor violation. Rightfully, since this would be an extremely silly
option.

> Perhaps you would also understand how my Amiga with OS2.0 operated for two
> weeks without having to reboot after two applications which had crashed were

If an application bombs out on an Atari, you don't have to reboot
either. Actually, in the time I did seriously use an Amiga, the system
usually didn't recover very well from the guru meditations.

> Regardsless, 1.3 featured smooth multitasking and could run software at
> various resolutions on different screens. If you don't think that is cool or
> useful then you are a twit, seriously.

[troll-response-mode on] MiNT has Vconsoles and can start and stop the
AES (gui) at will. My system is cooler than yours blah blah.
[troll-response-mode-off].

> From your comments it is plainly obvious that you do not know much about

Probably.. that must be why I am the system administrator and Linux
consultant here, and run my own webhosting company on the side, managing
a NetBSD server.

> and how they work which also explains why TOS would
> be so appealing to you.

I do prefer Linux (and OSX and MiNT) over plain TOS. I just never liked
Amiga's attempt at an operating system very much. It was ugly, slow and
unstable. And if it's only ugly, slow and unstable to someone who
doesn't know much about modern operating systems, it still sucks.

> I don't hate Atari's, on the contrary, but I do know how to spot illinformed

Have to agree with you. The last two places I have lived have been very
rural, very quiet, very crimefree, very lovely really. No chance of me
going back to live in a city which I did for 9 years before.

> This time, I'm at 3 kms of a city, so I use a 512Kbit line for internet, but

Ironically, because of a Welsh Government IT initative, our telephone
exchange is near to the end of a big 'pipe' and we can be enabled for
broadband if just 150 people sign up for it. So far we have 76 in just a
few months!

I think you already suggested me in a private mail to reformulate the title page of aranym website. I agree and will do it, I promise (feel free to remind me in a week if it's not changed, I am very busy with my regular job these days but I'll try to do something over the weekend).

>>> I would focus more on bug squashing, and making it work on "any"
>>> system.
>> I am glad you volunteer.
> That was a suggestion, I was not volunteering.

My mailbox is full of suggestions. I myself create suggestions for ARAnyM, too. I even put some of my own suggestions to the TODO file. Note that ARAnyM does not make any money, we even pay for it by our time, so you can keep suggesting but can't expect anything. Same goes for other projects. That's why I called for an active support and help for all free projects on our platform.

> I pointed a friend to the site, who don't even have any Atari's and said
> simply, go here and come back and give me your impression. You know

If somebody is not familiar with the situation in the "Atari" world it's hard for them to understand.

>>> Hatari works, they must have a mac guru in that camp.
>> And? Should I hire him?
> Maybe ask him for some help?

Hell! Why should _I_ ask him for some help? I don't own Mac! I think that _you_ should ask him for some help, or basically those that want ARAnyM running on Mac should do that. Do you get it? I don't owe you ARAnyM for Mac OS X, remember that please.

BTW, we have at least three guys working actively on the Mac OS X version of ARAnyM now. Actually ARAnyM always worked there but the state of the build tools don't allow easy building of it, it seems to me (judging from the aranym-dev mailing list).

>> Oh well. How long will it take you to understand the situation.
>
> I understand the situation completely.

No, you don't. This is not about words "emulator" vs "virtual machine", "Atari" vs "TOS" vs "GEM". This is about Free software in general. You ask the authors to do something they have neither resources nor direct interest in, you blame them for unfulfilled promises but you're just sitting there. This does not work in Free software world, I am afraid.

> Needless to say, I don't deem it worthless and realize it can be or is

> off as TOS hardware you can expect this sort of response from various
> people.

I am OK with people that call it Emulator. I am OK with guys that don't want to run it. But I hate to hear that it's our fault that ARAnyM does not run on your machine and that we failed completely since "ANY" does not work. BTW, have you tried running ARAnyM on Linux for Mac? Just asking, not suggesting anything...

Also, I explained many times very clearly why ARAnyM runs on top of another kernel instead of driving the hardware by its own. It's all about the amount of work required to get it running and to support the broad range of available hardware. Those that blame us for using an underlying kernel and its HW drivers must be complete ignorants - either in technical computer background or in listening to what others say in discussion, or even in both.

>other kind of virtual machine, who knows...

"a TOS compatible computer" ??
Aranym is just another emulator, forget all the hype that's been created and
is surrounding it, at the end of the day you're running Atari programs on a
PC. There's nothing new under the sun really... people are doing this sort
of thing since 1994.

>This is all true but the distinction between hardware and software is not
>at all clear any more! Just think of CT60 that is actually running on
>"programmable hardware" whatever that means...

This could be food for a very long thread, but tell me what would you
prefer: a real Rolex, or a fake one ? I know what I would prefer ;-)

Cheers from Belgium
Dennis

>multitasking,

I never owned or even used an Amiga, but it couldn't possibly be worser
then MacOS. No matter what incarnation of the MacOS is used and on what
hardware, it stinks. Multitasking and the MacOS are two words which don't
go together very well. In fact, IMO if you wanna see a Mac do some real
multitasking, then you better load MagiCMac. It's the living proof of how
bloated the MacOS is... oh and the same applies to that arse-kicking OS X.
It's even worser...

>and offered a lot of features we take for granted now.

Compared to what? MS Windows?

Jinnee beats the crap out of the OS 9.2.2 desktop in every aspect, and
let's not talk about the OS X desktop, that's a complete disaster.

Well, unfortunately in practice it works.
It's not the first time this "tactic" has been used here to stop a poster
posting his opinion. It seems that when a poster happens to be a programmer
or hardware developer he best has no opinion at all. Freedom of speech is
not everyone's right it seems.

Hi Micha,

>Everyone who run Atari software,need :speed,high color graphics,16bit
>sounds network,and with Aranym you have everything !!!Also invest in one
>Aranym system is not expensive !!! (AMD 2600+ for example)

Just like Janez, I'm not everyone either.
You obviously like Aranym on your Linux powered PC, well, good for you. But I don't share your views at all. I'm an emulator-user also, next to the Mac is my trusty TT, do you know why? Simple, to run *all* the stuff which the emulator can't cope with....

Suggesting here of all places to invest in a PC simply put is beyond words, I don't give a toss how cheap it is, even if it was offered free to me I wouldn't touch it with a crowbar. A PC stands for everything I dislike in the computing world, and no, Linux powering it doesn't make one single bit of difference, it's just as bloated as Windows.

>and with Aranym you have everything

Everything is quite a lot Micha, I'm not going to list the things which you ain't got, because it would be a very long list. And since people here even start making noice about an oversized sig...

But let's put it this way; you are able to run a pretty nice bunch of apps under your emulator, if these are all you care about, then you are indeed a happy emulator user. If on the other hand you wanna run things which don't fit in that "nice bunch" category you've got a problem, a problem which can only be solved by original hardware. But then I presume like most emulator users you disregard this "little" issue...

Cheers from Belgium

Hi Richard,

>I agree about the resource forks /except/ that you can easily add an
>extension to the filename for non MacOS machines.

But this has nothing to do with it. Suppose you download a jpg picture from the web which was created with Photoshop - that stupid MacOS will try to open it with Photoshop - even if you, **the user** would rather like to use for example Photoline to open *all* jpg's. What it boils down to is that the user isn't in control anymore, but the lame OS.
Download a couple of MP3's from Kazaa, and click on them, iTunes won't open but that stupid slow and bloated Quicktime thingy... etc, and don't tell me to start thinking "differently", in this case "different" means stupid. It's only when one uses a system for a while that he starts noticing the flaws, the more I use the Mac, the more I love my *small* multitasking capable OS, with it's *small* extremely usefull future loaden desktop app. Jinnee blows away the OS 9 and OS X desktop.

>OS X kicks arse. But then it should, it's Unix.

About the only thing that OS X has kicked so far is the wallet of users who happen to be blinded by the light & hype surrounding it. You realise that this is the 3th update at 119 Euro a piece, even MS wouldn't get away with this!! Not to mention that Apple like they've always done in the past, have changed some bits and pieces, so that with each update a lot of software needs to be replaced (some more money out the window).

>OS 7.5 is poor, OS 8 sucks, OS 9 is good again. Performas were never very
>good, but the 8500-9600 models were great.

The 8500-9600 models came standard installed with OS 7.6 - 8.1, so according to your logic - great machines, let down by a poor OS? ;-)

Argue as much as you like about which computer has the best OS, the best OS is a acronym and doesn't mean a thing. The deciding factor in the end is the available software for it, the living proof of this is a PC with Windows, PC-users don't buy a PC because it has a great OS, it's the enormous software catalogue available for it... that's the important factor. And that arse kicking OS X hasn't got much to show yet as far as apps go, whenever you need to use an app which doesn't fit in the standard run of the mill stuff, you've got to revert back to good old OS 9.

Cheers from Belgium
Dennis

>>as long as its hosted somwhere, this version doesn't do any justice at all
>>to MiNT, it should be removed and trashed.
>
>MacMiNT is a diffrent case. When I say: "KEMD, KGMD, MiNTOS, SpareMiNT,
>EasyMiNT" that are diffrent software distributions based on the same
>kernel. On the other hand MacMiNT is a fork of a kernel (a diffrent version
>of kernel).

OK, so let's call it a MiNT-offspring from now on ;-)
Although it's crap, the concept of porting it to the Mac was OK IMO, it
would allow at least people to use MiNT on a Mac, and it would take some
steam of the Aranym issue also. Not to mention that speedwise it would be
much easier to compare the port and the emulator.

>>Nothing really ever changes in here... someone feels the need
>>to declare MagiC and all its users dead, and then these "living dead" of
>>course come forward... and before you know it we have a new OS-War on our
>>hands, and it usally ends with MiNT-users feeling abused.
>
>Point one false statement in that thread that has been issued against
>Magic.
>I can point at least two agaist MiNT.

What's the point Adam? We'll just keep repeating ourselves. After having
been part of countless OS-Wars in here, and after having even started the odd
one out, we all sound like old cracked records, playing the same tune over
and over and over again... about everything which is written here concerning
this topic, has been written before, it's all available on Google.
So no, I'm not joining the party this time around :-)

Cheers from Belgium

Date: Sun, 25 Jan 2004 22:52:15 +1100

Hi Mark,

>1 - What is the biggest drive that can be fitted internally? It was fitted
>with a 200Mb Conner.

The sky is the limit so to the speak, I have a 36.5 GB IBM drive in the TT at the moment. Note however that you need to run MagiC or MiNT in order to use large partitions, I've partitioned mine in FAT32 format.

>I have had zip luck with a Quantum 2.1 ST. Only ICD utils will even detect it.
>AHDI 6.06, and Hddriver 7.6 will not recognise it all. The drive is set to ID0
>and term is on.

Sorry, can't help you here. IIRC there were a couple of Quantum models made that couldn't boot (Fireball etc...), but the hard diskdriver should recognise and partition these also.

>The only other drives I have are bigger than this. Oh, and what can TOS 3.06
>handle natively?

TOS 3.06 can handle partitions up to 512Mb each, when using BIGDOS you can use partitions which are about twice that size. To use larger sized partitions you have to use MagiC or MiNT (note that partitions >512MB won't be detected under TOS 3.06). In practice it's best to make a couple of "small" AHDI partitions which can be accessed by TOS as well.

>2 - How about ram expansion? 2Mb is less than my ST's. I had to resort to
>NVDI 2.5, because after installing NVDI 5 I only had 200k free. What are the
>limits to the TT's ram expansion?

The MagnumTT card can handle up to 256MB, it can easily be obtained from eBay for a realistic price. The Aixit card Janez referred to, can only accept up to 128Mb, but it's just as good and easy to install as the MagnumTT card.

>3- Also VME cards? What are available?

The first thing that springs to mind is a graphic card. If you ever have the chance to obtain a Nova card with ATI processor then beg, steal and borrow but don't let it pass you by... a TT with a *good* graphic card is about the best thing money can buy. There's also a Riebl network card available, to get hold of that card follow the same advice as given for the graphic card, a network card is the next best thing :-)
If you're into music and can afford it then there's also the wonderful and quite unique StarTrack card, that's an audio card which blows the Falcon audio features literally away. A DSP expansion card was made for it later also.

>Got to say tho, it is a bloody quick Machine:-)

You haven't seen anything yet, wait until it's expanded with a Nova card and powered by either MagiC or MiNT:-)

Oh, and if you look long and hard enough you may be able to find a CaTTamaran, that's a little gizmo which speeds up the processor to 50Mhz, this might not sound like a lot, but it really does make a difference.

Cheers from Belgium

>Specifically ICD Hosts, preferably ICD Link 2. Not Link 97! I cant afford
>New! That means no Dealers.Private Parties only. E-Mail Atari@aracnet.com

Sometimes I really wonder if you are for real.... :-/

I've read a lot of pathetic stuff lately, but this beats it all! So what we have here is a notorious Atari dealer who's asking his prospective customers where he can locate a particular piece of hardware. This reminds me of your posts when you needed to locate a MegaST.... please tell me that you're not going to pester us with this link host adapter post a year long like you did with the MegaST post...

Oh, and for what it's worth: if you wanna keep your customers happy, go for the Link '97 instead of the ICD link 2, and no, I'm not gonna tell you why, you are supposed to be the knowledgable dealer, not me.

Cheers from Belgium

Date: Wed, 21 Jan 2004 21:11:42 +0100

Hi Janez,

>>But that's not enough.... and you know it. Writing code is not easy, if it
>>was all computer users would write their own code and OS. IMO knowledge
>>and talent plays a big role. And that's what you pay for... most of those
>>greedy developers that left the platform, had more talent and knowledge in
>>their little toe then some of the open source maintainers in their whole
>>body. An yep, I know you don't agree... but then I''m not a dreamer but
>>quite down to earth.
>
> So what? They left us. I dont give a shit, if someone is as talented and
>mighty as god himself, if he left the platform.

Hey Janez, don't get your knickers in a twist.... once again you are reading
too much into my post, I've only tried to approach this issue with pure
logic. I realise that for you and some others here who actually code, this
is, well, somewhat painfull, but it's about time we face the facts.

And yep, I realise that they left us, but their apps, routines, standards etc
remain here. And we all use them knowingly or not on a daily base. Read it
again.

>Take Magic for example. Noone question its developers capability and
>talent, but who benefit last few years from that? Mac users. Users like
>me, Atari users, are stranded. Period.

OK let's take that *once again* as an example...
First of all I don't really feel stranded at all, I'm perfectly happy with
the way MagiC 6.2 is right now. It may have gone unnoticed here but the last
update/bugfix isn't even a year old. Having said this, your theory of MagiC
not being supported anymore is bullshit. N.AES 2.0 is getting on quite a bit
also, is that still supported? Or are N.AES users stranded?
Sure I would like to see a version 7.0 appear, I'm just as eager as anyone
else, but presuming that it would never happen, so what? According to your
logic I'll be stranded, well what if I like the spot where I've stranded?
What if perhaps the programmer thinks he squeezed out everything there is to
sqeeuze out from the original Atari hardware? Should he continue adding
stuff to MagiC which will make it more bloated and at the same time
impossible for some users to run anymore? What if the programmer thinks that
version 6.2 is the final TOS replacement? You and me may think different,
but in the end it's his choice... Or should he perhaps reinvent the wheel
and write a replacement for MagiCNet? Wait... I know, he could implement
support for toolbars, so that a two cent GFA basic programmer doesn't have to

borrow a GEM-lib from someone else, or heaven forbid, write his own routine. Seriously though, you ignore the philosophy which lies behind MagiC, it was ment to be an easy to use, non resources garbling-up multitasking OS. It is ment to run on all Atari's with 1MB, and more or less replace TOS. As far as this goes MagiC is perfect, but it's only human to want more of course, I have a wish-list for MagiC that's at least a mile long, *supposing* all of it would ever be implemented, well, then anyone with less then 8MB and a graphic card would be out of luck... and unfortunately that figure describes an awfull lot of Atari users. MiNT has passed the point of no return, it's not or hardly usable anymore on non expanded original ST/MegaST's, personally I think this is good, the ST line has been supported much too long, but it does leave these users out in the cold of course. MagiC 6.2 like it is now, offers them an alternative.

>U may ditch open source maintainers as u wish, fact is they do their job
>from love to platform, not for money. They also have mouth to feed,
>fauvorite greedy programers argument, but they still remains on platform
>doing stuff. And things like MiNT, Ace, Highwire and so on, can be compared
>to ANY product from comercial scene, talent and hard work wise.

First of all I'm not ditching anyone, all that I said was that in general the commercial programmers are more talented, and the *large* commercial software catalogue is living proof of this, and that software remains here...
And yep, of course MiNT can be compared to it's commercial counterpart, but you overlook one tiny, yet important detail: The MiNT community herited the MultiTOS package, after about 8 years, all the parts which weren't very good have been thrown out and replaced by more optimal code. Fine, but the fact remains that they didn't *create* it, MagiC and Geneva were both created from scratch by programmers with a vision and talent. You've once accused me of "messing around" in other people their code, well, depending how you look at it, isn't this exactly the same thing that the open source community does right now?
I'm not going to comment on Ace, I don't have a Falcon and have never seen it in action.... so let's take example three, Highwire: well Janez, you'll probably won't be surprised one little bit, but I disagree completely with your views. To what should I compare Highwire? certainly not to CAB? At this very moment it doesn't even come close, Wensuite perhaps? or Adamas, hell it's not even on par *yet* with that piece of crap! And yep I call Adamas crap, after being misinformed by the programmer I bought it and payed for two further updates, in the normal world we call this fraude.... the fact that it's freeware now, doesn't change anything to it.

Another point which is easily overlooked here is that CAB hasn't seen any development for the last five years, and even 2.8 was only a small bugfix really. So here you are, wanting me to compare Highwire with an app that hasn't been developed furher for the last six years, now, if you just relax for a moment and reflect on the fact that CAB was developed by one person, not a team, and how long it took him... not to mention that in that period the app was also compatible with the existing standards then how can you possibly claim that the open source community is just as talented, inventive and creative?

Hard work wise doesn't mean much, just like in real life there are people working their butts off, but at the end of the day produced less then someone "playing around" a little.

>And some of us (us, as im not best arround) make worse prods, so what,
>noone force anyone to use the products, and/or to pay for them... WTF we
>need then to listen this crap?

So nothing... this is not about coding the best or the worse apps, it's simply about stating facts. And moneywise doesn't really have to do much about it either, we've seen talented freeware- and shareware developers jump the ship just the same.

>I code purely for my joy and hobby.... and get attacked if im not
>bonded with commercial restraints.

You are *not* under attack, you've never came here annoucing crazy dreams to the dreamers, unlike some... on the contrary Janez, you're one of the few realistic people here.

>What many ppl dont understand is that so called non talented coders actualy
>make core of app/etc very well, just not forced to make some nifty GUI
>arround, since thats commercial requirement to sell stuff...

Read it again Janez, I'm talking about open source maintainers who take their dreams for granted...

Bloody hell!! Isn't it about time we start facing facts here? Instead of adding some more rubbish to MagiC vs MinT threads? It doesn't make one cent of difference what OS someone uses, its the apps that are important. Once again the painfull issue of the lack of a good newsreader was painfully clear the last weeks, there are tons of apps and utilities missing on this platform, but we all act like lemmings... Take that silly Amiga thread for example, it's a good thing that Clockmeister didn't start boasting about what Amiga users can do right now with their computer, when did we get to see the last innovative stuff appear? Going way back in time, I guess the last *new* application we seen was Porthos.

And here you are surprised that I dare to claim that the talent is gone and we're stuck with a lot of Lonny P's... Is there anyone here who would love to use a peer to peer client for example? I know I would :-) Will it ever happen on this platform, not very likely. Should I migrate to a bloody Amiga? They can do it...
What are we going to do when our trusty scanner, printer, CD writer or even hard disks retire? The new kids in town are called USB and Firewire, two new standards, that for now passed us by. Even if the hardware and the initial layers are developed who on earth is going to take care of the drivers? Hell, when are those dreamers finally gonna wake up? When the very last user jumped the ship perhaps?

I was really surprised to see you didn't go berzerk when you read my views on Teradesk -- another piece of useless programming -- while the whole world continues to go forward I'm expected to fall backwards admiring a desktop

which doesn't even come close to stuff programmed a decade ago! Have you read the posts in the "Atari 2004" dreamers thread? I've noticed a lot of stuff on people their lists, but no one mentioned a desktop replacement... So, am I unreasonable? Have I too much expectations? I think not, over the years I've learned not to expect anything anymore, if something happens to drop out the closet, then at least it's a pleasant surprise.

>Or demo coders, most talented of all, just realy hooby
>coders, code out of love to platform and scene, not money, thus even ST
>scene is strong and prods are awesome... not usefull for comercial users, i
>agree, but VERY talented!! And on meetings or o net, we dont argue bout
>crapy stuff, thats mainly and exclusively domain of users...

Well keep this attitude up for another odd 24 months and who knows, with a little luck you'll be freed of all those nasty users their comments, there simply won't be any left.
And before you get a fit: I'm not dismissing all these people their work, personally I don't give a toss about demo's, but I can imagine that there are people who think this is vital for the survival of this platform, let's all get back to the beginning --- wipe our hard disks, throw away expansions and other useless stuff and start enjoying the demo's again. the circle is full. We're back where we started :-(

Cheers from Belgium
Dennis

>creating and playing back samples then that YM POS. There were more people
>creating MOD's on their 1Mb Amigas then Atari users using their MIDI port,
>I'm willing to bet.

You'd probably lose. Besides, what use are MODs beyond saying "look what
my computer's sound chip can do". An Apple IIgs can comfortably urinate
on Paula from a great height, and when we bring in the STE and Falcon
sound hardware, the Amiga is again left behind.

MODs are cool, sure, but they're not useful in any way.

Its not a matter of u admitting that, i dont wanna now impose mine superiority or that im absolute right thingie... As i already said, id only wish, that when u state Aranym's specs on XXX CPU, as counter part u can notice that Falcon can do some tasks quite satisfactory. V may now see that not only I have probs with Aranym team (not u personaly) attitude toward older Ataris and NEW hardware projects on them. Aranym team member, in public, said some time ago, CT60 is useless project, so is ACP since Aranym is so much better and faster... and so on, i explained myself in mail...

>> of highest, its little psychological rochade, to impress ppl.
>

> (erm. GEM compatible desktop) hooked to internet via WiFi PCMCIA card...

What all that helps us, if no new software? As i said, when any of real Atari machines were introduced, new software emerged... in 2003, ACE was created, and its breakthru in Atari world, we didnt have similar software so far, and again, it was done on Falcon. Same as Papyurs etc, no need to list those, were started etc on TT, ST, Falcon... When Hades emerged, and Milan emerged what realy new things we got? Apart from Startrack i realy dont see something new... We got speed etc with them, but apps used were the same... CT60 is not as useless as Aranym team would like to show, and ACP for me, is interesting because it will be diferent... well if it happens, of course. Same as all living beigns need rich and various genetic pool, so we do as well.. Same as for some pro user Aranym may make a lot of diference wihth Calamus for example. Amd i realy welcome that and im glad he has that choice.. On other hand id like same freedom with choosing slower, older, dead machine, and its new addition if that suits me.. There Aranym ppl fails miserably...

> Ah, I just got it - you want us to remove the "Atari" word and call it
> a "GEM compatible machine". Well, you're damn right. The Atari is so long

> running on LINux? (no, it's not a typo - GEMLIN would be a bit dry,
> gremlin sounds cooler to me :) LOL

Well u see, patronising again. I dont think Atari need to be removed from name actualy. Rather remove "ONLY" from statements like ONLY future, ONLY light, or word USELESS when refering to non Aranym.... I doubt developers of new hardware or we buyers are particulary happy with that, when we mention that, this thread happens....

Yeah, but I dont see any argument.
Existing atari software already runs at maximum speed on genuine atari
hardware. If you are satisfied, you dont need aranym.
If you want more you have to buy.
And then you have free software available.
If you dont have atari hardware anymore, you also have to buy
if you want to continue atari work. You cant buy atari anymore,
so you buy cheap PC and run aranym for free.

I dont see any contra indication.

In fact Linux on Ataris is not so slow at all. Some things seem faster than under other OSes.

Yeah, during work hours, and I could replace its osc with a much, much
slower one during my spare time ;-)

Writing a good and compilcated program is a huge task. Most of the Atari softwre comes from pre-internet era, when it was not so easy to cooperate between developers far from each other, so most of the made their software commercial. Also the spirit of free software was not so strong as it is today.

> And yep, of course MiNT can be compared to it's commercial counterpart, but

They did. MiNT was written by Eric R. Smith who was part of a MiNT community for a long time. It was written from scratch without using any TOS sourcecode (even when Atari hired Eric to make MiNT beter).

>user isn't in control anymore, but the lame OS.

No, the lame user. You can set Photoline, GIMP, preview or whatever the
hell you want to open the document. If you don't know how then you're
even less qualified than I thought to suggest that Mac OS is lame. As it
is, OS X defaults to opening graphic (gif and jpeg) images in Preview.
It took two clicks to make it use Photoshop.

>Download a couple of MP3's from Kazaa, and click on them, iTunes won't open
>but that stupid slow and bloated Quicktime thingy... etc, and don't tell me
>to start thinking "differently", in this case "different" means stupid.

As a musician, you can take your MP3s from Kazaa and stick them up your
pirating ass. If you want your MP3s in iTunes, drag them. IIRC if I open
an MP3 on my machine (legal ones, thankyou), they open in iTunes, are
imported, moved to my music folder, categorised by artist, and
synchronised to my iPod.

>It's
>only when one uses a system for a while that he starts noticing the flaws,
>the more I use the Mac, the more I love my *small* multitasking capable OS,
>with it's *small* extremely usefull future loaden desktop app. Jinnee blows
>away the OS 9 and OS X desktop.

I don't know if I've tried Jinnee, but I know I used to have Magic on my
Falcon. It stank. I spent more time in plain ordinary TOS. I'm sure it
works fine for most people but it doesn't have the weight of
development. IIRC most OS upgrades on the Falcon resulted in something
that looked very nice, but was slow, and less reliable; maybe with CPU
upgrades it's a different matter, but nothing is going to match my 2 x
2.0GHz G5 - Rodolphe may be a genius with plenty of time, but I'm sure
he doesn't have time to create a PPC970 based Atari. Yet.

>About the only thing that OS X has kicked so far is the wallet of users who
>happen to be blinded by the light & hype surrounding it. You realise that
>this is the 3th update at 119 Euro a piece, even MS wouldn't get away with
>this!!

How much is MagiCMac or whatever it's called? It's certainly a lot more
than Linux, and IIRC, as much as the latest OS X release. For some

relatively pointless exercise in redundancy (why, when you have Linux
and Mac OS X, would anyone need an OS where the applications probably
outnumber the users). How much real support and development do you get
for your money.

You can surely do better than that. As for broken software; I've yet to
have any of my software cough on an OS X point update, and I use real,
expensive applications. Some stuff broke with OS 9 to OS X, but that is
to be expected since the whole thing was essentially new.

If you want OS X free. get OpenDarwin.

>The 8500-9600 models came standard installed with OS 7.6 - 8.1, so according
>to your logic - great machines, let down by a poor OS? ;-)

8.1 was good. 9.1 is better.

>And that arse
>kicking OS X hasn't got much to show yet as far as apps go, whenever you
>need to use an app which doesn't fit in the standard run of the mill stuff,
>you've got to revert back to good old OS 9.

Have you buggery. First of all, I'd say Office X and 2004 were quite
important major apps, as is the Adobe Creative Suite. Quark XPress is
there. Usual Mac stuff, of course, is everywhere. Even emulators are
generally available in Carbonised versions. I don't need to use OS 9 at
all now, and I do a /lot/ of different things with my Mac. As for 'non
standard run of the mill stuff'; get ye X11 and FinkCommander. It's
free, and included with the Xcode Tools (not Fink/Commander, but X11 and
the SDK). If you can find an app which isn't run of the mill, is
available under OS 9 (and not just an OS 9 specific fix for OS 9
features), and isn't available for Unix, I'll be extremely surprised.

All these OSen have their benefits, but if you're going to argue about
them, at least come up with something that is actually real.

Ugh. I've been lucky enough to have lived in or been in all fifty states, and on all seven continents. I detest Oklahoma. I won't be impolite and discuss what I think of a large proportion of the people who live there. That still leaves tornados, rattlesnakes, brown recluse spiders, black widow spiders, scorpions ... and those are just the things that slithered into my kitchen (well, the tornado wasn't in my kitchen - but it was only a short distance away).

Logic is good, execution isnt. Must admit that i don't save old messages, but if ud say that many comercial coders are very talented, u wouldnt set me off... But since they have more in little finger as any non comercial, i had to react, those 2 statements are VERY different...

> OK let's take that *once again* as an example...
> Having said this, your theory of
> MagiC not being supported anymore is bullshit. N.AES 2.0 is getting on
> quite a bit also, is that still supported? Or are N.AES users stranded?

I think u misunderstood me here. Magic is definately just fine, and of course the legacy of programers is here to stay. However, if coders left the scene, there wont be any new things from those. I dont mean new Magic version, or AES Toolbars (i can live with that, shows that Magic is different as MiNT, which is different as Geneva and so on...), but new apps with that. But fact remains, WE NEED new software if to survive as platform.. Not all ppl maybe, but in general we do need it... And what all that imense talent helps us, it its wasted on platform u hate so much: pc? This has nothing to do with any od OS wars, i realy dont want to engage that again... So great coders of the past are like relics, we may pray to them, well get nothing more....

So in short, since MiNT developers, who really made it proper Unix like os, way beter as realy crappy MultiTOS arent as capable as let say Magic developers? Im talking hypoteticaly here. This is just wrong.

> I'm not going to comment on Ace, I don't have a Falcon and have never seen
> it in action.... so let's take example three, Highwire: well Janez, you'll
> probably won't be surprised one little bit, but I disagree completely with
> your views. To what should I compare Highwire? certainly not to CAB?

Ok since u didnt see ACE, lets use Highwire. I do not expect u say its
alpha and omega! Comparing to CAB is not necessary or valid, i agree as
whole product. But u can try, notice FAST rendering of pages, realy good
pic quality and progress... And bugs, i must say 2 of my proposals were
implemented in days... Instead this, u kinda ditch it. Also, authors are
NOT motivated by money, so some good words, bug reports, bad choices by
them elaborated, are helpfull. OR u dont want Highwire to be developed to
usable stage and just disapear since CAB is good?

> Another point which is easily overlooked here is that CAB hasn't seen any
> development for the last five years, and even 2.8 was only a small bugfix
> really. So here you are, wanting me to compare Highwire with an app that

> how can you possibly claim that the open source community is just as
> talented, inventive and creative?

Well fact that CAB is not developed means not much. But Highwire
efectively is developed by one person as well. And i also can name u a LOT
of bad commercial apps. So not ALL commercial apps are good, in that manner
u also could finaly to stop generalising open source comunity as ALL coders
in it....

> Going way back in time, I guess the last *new* application we seen was
> Porthos.

Actualy it was ACE, and it is infact really inovative :) But TBH it is
Falcon only....

> Even if the hardware and the
> initial layers are developed who on earth is going to take care of the
> drivers? Hell, when are those dreamers finally gonna wake up? When the
> very last user jumped the ship perhaps?

Well hardware is main problem... No use to develop drivers without
hardware and its specs... However, it is VERY likely, the open source will
be main bridge to port USB etc drivers to Atari. And prolly some of non
talented programers will do it...

> I was really surprised to see you didn't go berzerk when you read my views
> on Teradesk -- another piece of useless programming -- while the whole
> world continues to go forward I'm expected to fall backwards admiring a
> desktop which doesn't even come close to stuff programmed a decade ago!

So i will do now. I agree its way from Jinnee/Thing. However, to call it
useless programing is, well wrong. Terra is limited, but it IS worked on,
and i bet Thing or Jinnee were as usable as Terra now in early stages. On

other hand, Terra prolly also is NOT aimed to replace Thing/Jinnee so i cant understand your bitterness here.. As i said, do we have so much programers left that we all of lower quality simply best to go and commit suicide, if we dont produce best app seen by man? Admiring and app is one thing, word of encouragement is another... No coder i know, expect to hear all best and i dont know what bout their app... they just want honest and polite opinion and bug report..

> And before you get a fit: I'm not dismissing all these people their work,
> personally I don't give a toss about demo's, but I can imagine that there

> let's all get back to the beginning --- wipe our hard disks, throw away
> expansions and other useless stuff and start enjoying the demo's again.
> the circle is full. We're back where we started :-(

I have no idea where u get that. What has admiting demo coders their wisdom and enjoying demos with deleting apps from hdd and throwing expansions? I enjoy demos a LOT, watch them regulary, really wonder how the fuck they manage that with ST or Falcon, whatewer... Same as i can enjoy great music, or picture... Why would admiting simple fact, that those coders are VERY good, affect and deny anything, or make u step back? Is it so damn hard to admit, that talent shows in MANY forms, if u dont find demos usable, atleast dont disqualify the coders who did it.

Janez

P.S. I used Napster a lot on Atari... but starting P2P app is tricky.... Any beta someone may produce, or test version, get in danger of spiting and such comments, even if early version and such...

Well problem is things break, and you need to replace them. Machines most
often outlast their perhipherals. How are you going to print with no new
drivers? How are you going to interact with ms word documents, etc

What happens when usenet or smtp protocols change to counter spam?
Another purpose gone. What about web browsing? Gone with the next
update. Open stuff at least stems the work. We can use libxml, freetype,
etc. Even apps that are puregem depend heavily on free and open stuff,
like porthos and freetype, which incidentally I have never gotten to load
a pdf.... EVER! (although now I wonder if it's because of my fpu issues)

Well perhaps. But most of the programmers I know care only about MiNT.
You and I probably only know a small subset. Some of these coders are
recluse and hide from everyone ;-) We don't know what their priorities
are so there's really no way to gauge and that was my point.

You're right about this. And I never understood it, but I suppose a lot
of people were under a silly belief that everythign should run on 4 megs
and always will. Maybe they also though Atari wouldn't turn belly up, so

it never really hit home that they have to show support for their platform. That's my guess. But now things are different. now the people left realize that THEY, as in each person who may read this, is required to make things happen. It's a different world than it was in 1989. And back in 1989 I didn't give a shit if I could get true color graphics. I was happy with 320x240x16bit.. Maybe these upgrades came too early, or maybe atari should have built it into the machine to begin with (that's my opinion).

>>150 people who bought the CT60 can't be completely insane.

Only god knows. Sometimes I really truely wonder how many people are left. I suspect not very many. Maybe 100 programmers MAX and falling. Probably 3 users on top of it. It's a scary thing to face, but I don't have any reason to suspect otherwise.

It's a lot of damn work. But I am trudging away. I'm working on what I can, and learning to do what I currently can't. I will make it happen, but at my own pace. After all, there's no paycheck for me.

Okay I'll go ahead and grudgingly agree. As a programmer I agree that
something better needs to be made, but as someone inexperienced with such
things, I just have no idea how long it takes. How much motivation you
need. Maybe those programmers were good enough that they felt they could
charge money ;) But I agree.. Things should be at least better than they
were many years ago.... for sure.

Maybe that's true, maybe it isn't. Since I am not one of those glorious
programmers (no bullshit sarcasm here either), I can't judge if people
like Frank Nauman or Ozk, or Henk Robbers are stupid or untalented. But
currently, their skills blow mine away, so currently they are who I aspire
to be.

Actually my linux box garbles up 0.5GB already, but of course I _AM_
running 3 OS's simultaneously on it ;-) Including godawful windows 2000.

Okay.. true.. I can't claim that I use anything other than Jinnee or
Thing demo right now. One problem with atari is too much stuff to buy.
NVDI for instance should be free with the system. Atari should have done
it right to begin with, or else they should have left the OS to another
company. All our extensions that cost money are bullshit, cdrom burner
supoprt, etc. Bullshit bullshit.

> MiNT and/or MagiC any justice, it might one day, but until then like I

Oooh.. this is a sticky one for me. I use highwire regularly, I can't
stand cab anymore. What's the point of having forms support if 90% of
them don't work anyway? Highwire is damn nice in my opinion.

> And that's how I compare software, I don't give a toss if something is

Well then, that's probably why yuo are using MagiC and ASH applications,
because when it comes down to it they have the asthetics, teh speed (some
of them), and definitely hte features. And use them for now... most
people probably will. But some day by your own admission, you may be
hopping the open source bandwagon.. ;-)

Hi All,

I just came in to possesion a a Farallon networking device. An rj45 and a BNC connection on the one end, and on the other end a connection that fits perfectly into the Falcons localtalk port.
My question is: Have I fallen in to some great luck here or is this gonna be a bust from the start. In otherworks, is the Farallon okay to use?

Thanks,

Sam F.
Seattle Seahawks Nut
and Atari Computer Nut
C-Lab Falcon, 14mbram,540mb hdd.

Yes, that is a possibility.

And who knows, maybe there might be TOS compatible hardware produced
in the future? If new hardware will be produced (Coldfire based or
other, who knows), it would be likely to run FreeMiNT, thus also being
free in the same sense as ARAnyM is free :)

I'll check for sources here, but I'm not betting on it.

I'm running Magic5 now, and really do want to upgrade to the latest Atari version. And I can say that I would be perfectly happy with that.

I don't think so. I recall the Frontier xtraram+8 and the magnum cards all needed 2.06. Actually I think these cards were designed to act as Alternative ram and not ST ram. 4MB was the ST ram limit in all but Tos 3 and 4. This was because of the MMU. The most you could address was 14 meg as the upper 2 meg was used by I/O. Of course I could be wrong;-)

933. Low/Mid Resolution Display problem with Atari MEGA 1

Newsgroup: comp.sys.atari.st
Date: 2004-01-28 23:51:22 UTC
From: Jason Davey <acs@webaxs.net>
Message-ID: <bv9hu2okg1@arachne.labyrinth.net.au>
Source record: 21021

Hi all
I recently acquired a MEGA 1 which runs in Hi Res but will not display in Low/Mid Res. I have auto booted games and the sound works fine but I get a blank display. I have only tried this with composite out not RGB which I will try when I make up a suitable lead. May be there is a problem with the composite out?

I'm assuming the Hi Res circuits are separate from the low/mid res circuits (I'm sure I read that somewhere in the past) and if so could I be lucky enough to be able to replace a socketed chip to fix the problem?

If any one can shed some light on this that would be great!

Thanks in advance :)

Jason

I've actually done a fair bit of research on this. It would seem that all NON-STE Atari ST's do not have composite out whatsoever. Where as STe's do and it works just fine. This is probably why you see nothing. If you hook it up to your TV it should work in low/med rez (assuming you have a modulator), and if you don't you'll need to find an rgb monitor. There might perhaps be a way to convert the rgb signals to composite but I don't know.

You can use a RGB monitor, But you have to have a custom cable made which
can exceed the ST monitor! I had a cable made for a Magnavox RGB 80
(Commodore 1084) from Redmond Cable for like $20.

How it looks on the ST memory map, the first 14meg is the ram area, the next
few K is ROM and the next is reserved, which gives 16meg before the catridge
rom, since TOS 2.6 (I think) is bigger than the rom area it gets moved
higher up which leaves 16meg free, Thats how it looks to me anyways......

Being that the 68000 can only address 16meg I guess it must be mapped
between 4 and 14 meg. Obviously TT ram is above 16Meg because the 68030
can address 4 gig of ram. All IO is at 14-16 meg AFAIK. This includes
cart Rom and OS Rom.
Not attempting to break the 4meg barrier are you?

>> >creating MOD's on their 1Mb Amigas then Atari users using their MIDI
>port,
>> >I'm willing to bet.

Hahaha. That is SOOO funny! MODs are so constricting in the type of music one can compose. No music notation, no easy note editing, chords have to be resampled for each chord, scratchy low-quality samples, machine sounding rhythms, etc. I just can't see how anyone can work in such a constricting environment. MODs are really only good for techno/dance music.

MIDI allows high quality samples (depending on your equipment), easy note and chord editing (just click on a note and drag it), swing times, etc. That is why MIDI (and in particular, Atari MIDI) has survived so long and used so much in pro music today. I've never heard of any pro musician proudly say, "I created all my music on my CD with MOD trackers." Try going into a pro music store today and asking them about MODs/trackers. They will probably not know what you're talking about or laugh in your face. 'why? Because barely anyone uses MODs/trackers anymore! Everyone uses softsynths or MIDI!

The Atari MIDI mailing list has HUNDREDS of members and growing all the time. MIDI rules.

You need to get out of your little MOD world and get into the real MIDI world...

OK, this is a good idea. The FreeMiNT 1.16 is still evolving but the source code is not likely to grow much so perhaps we could measure that one. The 1.15.12 would be a safe bet but who would be recompiling such an old version? :)

> We can only hope they succeed then. Unfortunately I cannot help even
> though I have an up to date system with xcode

From what I read in the mailing list I feel like it's real hard to compile something on macosx. There is a project builder, and now the xcode, but paths are incorrect, and things are missing... It's unfortunate to watch the guys trying to just produce a binary without being able to help them (the source code is compilable, there is no problem, only the process of actually making the final binary is not done) and receiving complaints in discussions like this one that we run on linux only. I don't like feeling helpless, you know.

>> interest in, you blame them for unfulfilled promises but you're just
>> sitting there. This does not work in Free software world, I am afraid.
>
> Ok, maybe my original expectation was to high. I have no skill in that
> area so I can only sit and wait.

I believe you can do much more than just sit and wait. I am talking about one thing: if something does not work in a free project, try to support the authors in any way so it starts working. I think I could ask google for "how to support free software if I am not programmer" but instead I'd give you some examples selected specially for the Atari (erm. TOS compatible) world:

Simple example: instead of writing to an unrelated web list discussion "MiNT sucks, MagiC is so much faster" it's IMHO way better to ask in the MiNT mailing list: "guys, I like MiNT but can't use it on my machine cause it's too slow, can you help me make it running faster?"

Another example: instead of trying to find out why CAB 2.8 has a problem with bookmarks on VFAT partitions and fixing it by downgrading to CAB 2.7 I would think that joining the HighWire mailing list or their web forum and telling them "guys, HighWire rocks, I am missing this last feature XXX to abandon the unsupported and dead CAB and replace it with your HighWire" would be a much better thing.

And I could go on with the examples but I am sure you know what I mean. The key is to realize what has CAB and MagiC in common, and what's is in common for FreeMiNT and HighWire. As soon as you find the pattern you can go on for all the software you like to use.

> I am really happy with macosx, and I really don't want to change it over
> or dual boot. It's a valid question, no harm asking that.

I know we promised "Any Machine" without further restrictions but even now it is possible to run ARAnyM on more hardware than some of readers here think - thanks to the linux kernel running on almost any hardware.. Thus I could be replying "install linux on your mac" to the "aranym doesn't run on mac" complaint but I won't do that as Stefan and others are working on the native mac osx port of aranym.

Actually ARAnyM is much more relying on the SDL than on the underlying kernel itself. So perhaps it would be much more accurate to say that aranym runs on the following platforms:

http://www.libsdl.org/intro/whatplatforms.html

Although this page is obsolete since it doesn't list Patrice's work on SDL for Atari (or TOS hardware? Or MiNT hardware.. never know how to define it properly ;-)

> Anyway the only other comment I wish to make is that you referred to the
> mintlist discussion as "complaints". That I disagree with greatly.

It was a mixture at first (caused by different expectations, wrong understanding due to my aranym.sf.net page, etc) but later there were mostly valid replies with some very good points (I had a long private discussion with Frank himself which helped me to understand some pretty important things).

> realize some of them were not as you had hoped, but still they were
> requested after all. ;-)

And were helpful, thanks. Each reaction helps us in defining the direction of further aranym development (just please note that while positive reactions speed the development up the negative ones cause developers to abandon the project completely - but I explained it earlier that free projects live from the interest and support of their users).

Most SVGA monitors can be used on a ST with a special adaptor. You will
only get ST HIGH 640*400 monochrome, though.

Check for how much RAM the computer has. 520 ST are quite hade to expand,
better to get a 520 STe and put in four 1 MB SIMMS.

AfaIk ST's with RF modulator have composite out. As Mega's does not have
RF no composite. All STe have RF built in but also the older STfm (where
the m stands for modulator).

Contrary to those thousands of tracker tunes hidden away in obscure scene directories, you'll find Atari created MIDI masterpieces in seriously published music. Especially in the first ten years after the ST was released, most composers relied on them (most mainstream dance producers, but also great names like Klaus Schulze). Some still do, like Fatboy Slim; watch the interview on the Moulin Rouge DVD.. yes, that music is also composed on an ST.

(This might be why "Atari" is even mentioned in Lady Marmalade's lyrics!) ;)

Maurits.

Oh, http://www.modarchive.com/ is hardly obscure, just off the top of my
head. Aminet has a large Amiga created MOD section.

Especially in the first ten years after the
> ST was released, most composers relied on them (most mainstream dance

I'm just comparing modfiles to normally published music.

> Great, but it sounds so clinical.

Oh, and modfiles don't? :)

> Fatboy Slim doesn't blow my hair back either.

Well, he sucks according to me, but he was the first name that came to
mind. My point is, Ataris were (and sometimes still are) used by pro
composers, modfiles (sometimes also made on Ataris btw) are used by
sceners. I think you'll find more Atari compositions than modfiles in
the average music lover's CD collection.

Maurits.

>is funny.

Yes, real pros do still use Ataris. Most serious musicians have an ST
floating around, even if it's just for communicating with some ancient
bit of music hardware or keeping their old songs.

Pros /did/ use Ataris. Vince Clarke, Depeche Mode, hell, pretty much
anyone who couldn't afford a Synclavier, S.A.W... anything that was
sequenced in the mid 80s usually had an Atari attached, and this
continued for a long time. Pros didn't use Amigas, and IIRC no MOD file
has ever got into the UK or Billboard charts.

Sound on Sound only recently dropped their Atari Column. Analogic still
sell Ataris in the back of the mag.

You can argue all the points you like about the OS, but where music is
concerned the Atari is still very useful and active - arguing otherwise
just makes you look very ill-informed.

Does anyone know where I can get Expand, the software sampler? If anyone has a copy to sell let me know.
Thanks, Mark

My arguement is not that Atari didn't do for music what the Amiga did for
graphics, my point is that on a 1Mb Amiga MOD music could be created by
anyone without having to outlay for any other hardware.

Amigas were and still are used professionally for sound and music, just last
year a PS2 game came out which credited an Amiga 1200 for the music
production in the game. I wish I could remember the title of the game...

Ofcourse the Amiga's speech synthesiser has appeared and continues to appear
in various forms in commercial productions as well.

The current switched DAC of Paula produces a distinct ring ;-)

Who cares about CD collections when it is music I want to create without
additional hardware (except maybe a sampler, although I did without) for me
and my likeminded pals?

You will find no Atari or Amiga music productions in my CD collection ;-) I
did produce a couple of mods featuring guitar pieces played by me. I
borrowed a friends sampler and used my 1Mb A500 with external drive.

Long lost, unfortunately, amazing what disappears (along with a diary) when
moving house :-(

Ah, see, I'm very much into the 80s. My CD collection has everything
from Sandra and Hall & Oates to Sisters of Mercy, Jarre and some 70s
stuff.

In fact, the only music I don't like is R&B/Gangsta.

>>Just curious, do people still use Atari ST computers to access the internet?

Hi there

I did until a while ago. I had a pay-as-you-go Freeserve account so accessed it with STing using a dial script for it but Fserve changed their log-in configuration so it no longer logs-in properly. As scripts for other ISPs in Britain are less than forthcoming for STing now, I can't access my main account with my ST.

For the record I used POPwatch for receiving mail, NEWSie for sending mail and reading/writing news and CAB for web surfing. At a max speed of 9200 kbps, it was never going to set the world aflame speed-wise but it still surprises people!

Cheers
Al

>Just curious, do people still use Atari ST computers to access the internet?
My STe is connected to the Internet through an ethernet card that
plugs into the cartridge port. I use it now and then, but use my
Hades060 mostly. I just wanted to have a backup just in case my
Hades went under. My STe can pick up and send my email and also
broswes the Internet using Cab.

Actually there is an adapter than you can buy that will let you
use most any SVGA monitor on the ST, but is mono only. If you can
get a piece of hardware for the Atari called "Video Key" and then
get a video converter, you can hook up the ST to a SVGA monitor in
the color mode. That is what I have done from time to time.

I have noticed things like that under MagicNet and Arcview. If I
downloaded a ZIP file using Dan's cab.ovl and Cab, the Zip file
sometimes game me errors. If I used the MagicNet cab.ovl, the file
unzipped fine. But now that I have upgraded to Magic 6.2, Dan's
cab.ovl has worked fine.

Yes Raoul that is possible. A friend of mine gave a 1GB Jaz cart
that was pre-formatted for a Mac. I just used HDDriver and re-
formatted it for the Atari and it works fine now.

I have Jinnee 2.5 and it works great for me. You need this version
if you want to use it under MintNet/N.Aes 2.0. Version 1 will
work, but the icons are all messed up. I do not think there is any
place in the US that sells it. I got mine from 16/32 Systems. Nice
place to do business with. I just got my Papyrus version X upgrade
from them also.

Are you using a Monochrome monitor with the Mega 1? If so, you
need to get an emulator for the low/med resolutions or just go
out and buy a color monitor.

That sounds like that SYS file on the hard disk needs adjusting. I
would remove it, run the ultility program and build another one.

Galen which version of ScanX Pro do you have? I have 1.13 R3. I
did a lising of the binary using Qed and the Astra 1200S is
listed, but not the 2200S that I have. The 2400S is listed though.
I just wish Nima would email me back. I know he needs to upgrade
the program.

SF0218 wrote:

> So how much ram can a Falcon handle. Mine has got the Wizztronics memory board
> and a stick of 16meg ram. Could I go higher on this board, say 32 megs?

Without special hardware, the Falcon can handle 14MB (often 16MB of
simms are used for this). But there are expansions that allow for more,
for example the Centurbo2 which can handle 128MB (or was it even more?).
The CT60 probably handles even more but I don't know that one very well. :)

To be more precise, the Falcon can handle 14MB of ST-ram and a huge
amount of TT-ram. But to be able to use TT-ram, you need special cards
like the Centurbo. Further limitations depend on these cards.

Maurits.

From what I have read, nobody has tried that yet. The localtalk port is a serial port. There are no drivers for serial to ethernet through a localtalk-shaped port. There are STiNG drivers for a SCSI port to ethernet adapter. There may be MiNT drivers for a cartridge port.

Perhaps, and only perhaps, the cartridge port driver, for a D600 pocket ethernet printer port adapter and an interface card, could be re-directed to the localtalk-shaped port. That would take some programming.

Unless someone else has a better idea, you have a nice piece of hardware with no Atari drivers for it.

Jim

From: Jim DeClercq <jimd@panix3.panix.com>
Message-ID: <bvbbcv$8b4$2@reader2.panix.com>
Source record: 20978

Do you have a Best Electronics catalog? If not, buy one. Or, check the website first. The price change sheet that comes with it lists a bunch of suitable monitors, as does page 189 of the catalog.

And, I think that Best will make whatever cable you need to connect one.

In answer to your question, some of those monitors in thrift stores will work on the ST.

But if you are using an ST as a MIDI controller, you will probably want an Atari monochrome monitor.

Jim

Bass Guitar God <drsmith666@aol.com> writes:

As long as it is ST-RAM: yes, TOS 1.04 (even 1.02) can handle up to 15MB.

To use alternate RAM, you need 2.06.

cu

I'm thinking of going for the "Tab board" though its a bit confuzzeling
whats going on there since there is only fitting instructions. IF plane TOS
can work ok for ST ram then it makes life a bit easier. I've seen TTram in
the memory map, though is this what you call alternative ram or is it
something else ?

Chris

Will someone PLEASE take this mutating thread outside and shoot it!

Or better still, opt for the ancient greek classical era method of disposing of pointless and unwanted things, by leaving it exposed to die on a cold bare mountain ;-)

You are mostly right! In the first line of STs (520ST, 1040ST, 1040STfm but i
am not sure for the STE) the 68000 processor is limited to 16 meg. To reduce
the complexity of memory adressing, you need a MMU and Atari choose a
compromise: the upper 2 meg is reserved for ROM, I/O and cartridge port. And as
stupid as it may seem, the cartridge port is read only!!

The lower 4 meg is for system RAM. This is done by the MMU i.e. in hardware.
The remaining 10 megs is a blackhole: you can do nothing to access it UNLESS you
change the hardware!

I bought one of the very first 520ST back in 1985, well, the second generation
in fact. (the firsts STs had only a 2k ROM installed, you had to boot the
Operating System from a diskette!) My primary interest was picture processing
and 512k is not enough. my dealer (now my best friend) did upgrade my ST to
1 meg. I soon found out that it was not enough so i took "Atari ST Internals"
by Abacus, a soldering iron and all the courage i could find to upgrade my ST to
4 megs. Here is the messy but working result:
http://pages.infinit.net/benoitm/Atari.jpg

Of course, 4 megs was still not enough so i began to investigate on the
possibility to get those last 10 megs and this where i discovered the MMU black
hole. I actualy began to build a whole new MMU with TTL chips but i soon
realised that it was out of my league so i bought an Atari 286-12 with 4 megs,
later upgraded to 16 megs and a 287 Math coprocessor.

Needless to say, i now have a Duron-700 with 256 megs and i STILL need more
memory... but i am disgressing...

If you put a new TOS in an old ST, you will NOT get 14megs: it is a hardware limit, not a software one.

May the Lord bless you
Good night!

> 192K is the system rom, but what is the 512K tos rom ?!

pfff, this is a map for ALL TOS Machines (Falcon 030, TT AND ST !)
And it is not 512KB but 1MB for the falcon !
Hey , E0 to EF = 1 MB, not 512 KB !

On ST STF & MST, Exxxxxx ROM space is not decoded !
On Falcon,STE, MSTE & TT FC to FE ROM space is not decoded !

Clear ??

1001. SCSI CD drive on Falcon

Newsgroup: comp.sys.atari.st
Date: 2004-01-29 17:30:02 UTC
From: sf0218@aol.com
Message-ID: <20040129123002.19998.00000896@mb-m17.aol.com>
Source record: 20990

Hello All,

I've got a curious problem that even Wizztronic, after having my Falcon for nearly a year, couldn't fix, or at least duplicate in order to fix.

Then again, it could be the way I'm doing things i.e., incorrectly!!

I have extendos pro installed. I have a 2x scsi cd drive. When I boot my Falcon, then powerup the cd drive, my data on C:\ gets all screwed up. I don't know why.
The scsi id on the cd drive is set to 5. The scsi cable was replaced after this happened the first time, so I don't think it's the cable.

Is there a particular order that the Falcon and external devices need to be powered up?

Again, Wizztronics stated they hooked up a cd drive to it and had no problems.

Hopefully, one of you might know or be able to point to what the problem is.

See, this is why I want to re-case the Falcon, get a higher capacity psu, and use ide drives.

Oh well, thanks for the attention and help.

TO BE CLEAR :

ALTERNATIVE RAM is what you declare to the system (gemdos ? Start address &
size) as expanded ram (this ram cannot be accessed by the video chip !).
All machine from ST to Falcon can get alternative ram.

TT-RAM is a term for TT only !!
TT = Thirty two Thirty two shall I call again ???

This means that Falcon with card on the slot bus to add memory from 4 MB to
8 or 12 MB cannot be TT-RAM !!
Why ????
eh eh because the falcon data bus is 16-bit !!

Only TT & CT2 / CT60 have TT-RAM = 32-bit ram.
Sure, this ram can be named Alternative ram too...

The inverse is false; Alternative ram may not be TT-ram....

To conclude TT-RAM is a 32-bit alternative ram ....

Hi Sam,
As far as I understand (I will be corrected if wrong :) it sounds
like a termination problem. Make sure that only the last device in the
physical chain is terminated, all devices have different ID #s and
don't set any device to #7.

John

A little neater than my efforts
http://www.cps-games.co.uk/PROJECTS/projects.htm

though to go up one I built a 72pin simm adapter yesterday which plugs around the shifter, still some wires to the res's though getting better, with all this messing around with ram is what makes me want to try to hit the 14meg barrier! I will try and get a scan of my current ST soon.......

I briefly tried the demo but it crashed quite soon after starting it. I assume the proper release is a better.

I also had few problems with some of the file/folder names which had "illegal" characters in them. This may be because it is the German version.

I have the full Papyrus Office version 8 so I will no doubt uprgrade. I happen to be one of those who really like Papyrus. There are a few things it doesn't do or maybe I've just never worked out how to do them. Nothings perfect.

That's because they were mostly Dr. Dre's ideas, which we now get to
hear from D12? I think. And Missy Elliott.

8 Mile destroyed what little credibility he had left.

1. put CD on ID 0 and Falcon on ID 7
2. power the cd rom drive first then computer
3. make sure you terminated the scsi chain properly
4. make sure your C: partition is not bigger than 16 Mb
5. check your hard disk driver

:)

1020. Hatari Emulator Question

Newsgroup: comp.sys.atari.st
Date: 2004-01-29 21:16:50 UTC
From: peterslegg@===ANTI-SPAM===scubadivers.co.uk
Message-ID: <40197842.0@entanet>
Source record: 20910

I was reading some info about Norman Feske's work on the
Coldfire motherboard. If I understood correctly the Hatari
emulator is running on the board.

Would Hatari be a suitable candidate for a Milan ST emulator ?
Does anyone (with a Milan) feel the urge to try compiling it ?
Apparently it needs SDL and I suspect that the cpu emulator code
could be dumped at some point.

Regards,

Peter

1021. USA Atari computer users

The ST was a reasonable compromise of features and price. It made
less arcane computing highly accessable. It did this better than
the Amiga did.

Scripts? Normally ou should use any scripts to get a ppp connection.
Authentication is built into the protocol. If the the provider uses CHAP
instead of the more common PAP login protocol you are lost.

For a standard modem dialin STinG setup you should as a rule only do any
manual editing of scripts or other files if you really know what you are
doing.

Based on what I have seen, I think the 68060 may not be fast enough to properly emulate a 68k processor, of course some sort of "JIT" could be made specific for the 060 that might help out. Emulation isn't so tough when it's almost a native chip ;-) And aside from speed issues, I have no doubt hatari could be modified to run on a ct60 or milan. Now how much work it would be, that's for someone else to say.

Sales figures would suggest otherwise, and digital imaging and effects were pioneered on the Amiga both commercially and affordably for the home user.

To suggest otherwise is plain rediculous.

I would suggest that digital imaging was primarily a Mac field. Video is
another matter, though you needed a farm of expensively modified Amigas
to do anything useful.

Sam,
I have my CD-Burner as id5 and my CD-Rom as id6. I
always power up the CD devices and SCSI hard drive
first. Once the Hard drive has spun up I then turn on
the Falcon 030. If you dont have devices switched
on before booting they cannot be recognized when the
computer is on. C: partition can be any size as long
as it is a TOS compatible partition, mine is 175 megs.
Hope this helps.

Thanks,

Sam,
I have a CNet 56K modem that I am not using since I have switched to broadband. The modem still works if you want it I paid over 75 dollars for it. Throw me a few bucks for S/H and a little for the modem and it is yours. Like I said it worked great for 56K and has 8 leds on the front panel. When I was on 56K dialup I used a local ISP called Metalink.net. I am sure this is not in your area. Ussually if you stick to a local ISP they work better than the big companies like AOL or MSN!!! Hope this helps, if not drop me a line in my e-mail. The respond to should be OK.

Thanks,

Well folks, it happened again. This time it happened while I was copying files over from the Extendos disk. Folders on the drive started having strange characters in place of the letters. And yeah, the boot partition is pretty much toast. Luckily, I copied the entire boot partition into a folder on the other (D) partition. Hopefully, all I'll have to do is re-format the boot partition, then just copy everything back over to it and viola!
Man, whatever you can think of folks. I'm starting to pull my hair out again, and I don't have a whole lot of it left.

Hi folks,
Is there a way to hook a Megafile 30 to a Mega STe for large .sng file transfers? When doing routine maintenence on my live show or sequencing for the studio I work on the megafile 30, then transfer all the files via floppy to the Mega STe, very time consuming. Any way to trick the Mega STe into thinking the Megafile 30 is the D, E or F drive? Or any suggestions for a quicker way to transfer files other than floppies?
Thanks,
fcr

Ah an easy one:-), what are using for your live shows, an ST? And what
Hard disk driver software are you using? If you have AHDI or ICD on the
MegaSTE it should just detect it. Plug it in to the MegaSTE dma port,
switch drive then computer on. Boot to desktop, click on options and
select 'Install Drives'. If you are using HDdriver it may be a bit more
convoluted.

This could be wrong,

It sounds as though you have a mega ste with an internal hard drive. When
you use an internal scsi host adapter it removes the connections from the
pins on the internal DMA (ACSI port). I don't KNOW for sure, but I
suspect that this disconnects the external port. Unless it has a
pass-thru connection for each pin pair, then it does. For instance, if
you remove the internal host adapter, without putting jumpers over each of
the right pins, your external ACSI port will be completely disabled!
Maybe someone can say for sure one way or another.

So.. you may be screwed for using external and internal acsi device at the
same time :)

Thanks,
Mark

The CD-ROM drive can have any SCSI-ID not yet used by another device.

> 4. make sure your C: partition is not bigger than 16 Mb

Why? C: can be as big as any other partition. There is no special size
restriction for the boot partition.

With HDDRIVER it's the same, unless it has been configured not to check
the Megafile's device ID.
Note that AHDI will *not* detect the Megafile if there is a gap before
the Megafile's device ID: AHDI stops checking for devices as soon as it
finds an unused device ID.

5 is ok for the CDROM and you must terminate it.
You need Extendos to set the drive letter to access the CDROM!
Get HDDriver instead of ICD.

Digitizing images in 4096 colours was childsplay on my A500, and hardly
expensive. The Amiga was used extensively in professional and amateur
productions, surely you are not denying that?

I thought we were going to "time make" (i.e. measure the time needed for
a kernel recompile) and for that a standard source file archive would be
a good thing. You know, few years ago people liked to tell "I can compile
Linux kernel in less than two hours" and it was kind of a widely used
benchmark. But as the kernel grew in size over time it became impossible
to compare the results. Same thing could happen with the CVS
version of FreeMiNT 1.16alpha - that's what I was talking about. But it's
not likely to grow much in short time (well, unless the AES and VDI get
integrated suddenly ;-).

> I surfed the archive, and I see what you mean.

Yesterday I added a complete support for Project Builder that was
sent to me by Carlo (never heard of him before - he just appeared and
sent it - a nice surprise after months or even years of darwin
semi-support). Somebody must try it out if it really produces a working
binary or not.

>> I believe you can do much more than just sit and wait. I am talking

>Sure, but I can point you to sites with literally thousands of tracker/MOD
>tunes but where do I find all these Atari created MIDI masterpieces?

Try your local CD store.

I had some guys come into my studio once for a recording session with
their Amoeba. "Yeah, we have created a song, can you record it for
us?"

This was a 24 track studio with all the bells and whistles, loads of
MIDI gear, effects, 36 channel mixer etc.

Of course all they had was a hissy stereo-out, and no way to sync to
anything external, so we ended up plugging the left and right outputs
into two channels of the desk, and then I hit 'record' and they hit
'play'...

It was a fantastic experience in my career as a musician/producer,
needless to say I chucked my Atari after I heard the professional
quality of MOD audio, and saw the amazing possibilities the Amiga
offered for creating and recording songs ;-)

JM

> Thanks. The hard drive is internal scsi. How would I spin this up first?

You can set up a boot delay with an NVRAM setting utility - this will cause the Falcon to pause whilst your SCSI drive gets up to speed.

If you get an IDE drive then you can reduce this delay to 0 seconds.

You will still have a problem with your SCSI bus, from the report you give this would seem to be a setting problem with your CDROM (temination, temination power) or an actual fault with it.

Don't get fixated on that requirement - if you can get a few details re
server addresses and the actual phone-in number from the ISP's help page
then plug them into STiNG and give it a bash. As long as it uses PAP
authentication hopefully it should just work.

You can download this hard disk driver from <http://home.t-online.de/home/Steffen.Engel/>

And there are some translations on the MISC section of my web site.

I'm suggesting that as an experiment you run scsidrv.prg from the desktop with the scanner switched on to see if ScanX can then find it; then that should give you some idea of whether you have a problem with the version of HDDriver that you're running. I wouldn't suggest running both drivers together as a long-term fix.

It might also pay to try the "patch" that has already been suggested on a copy of ScanX.

How about 90's techno/dance? Most of that has been made on Ataris.
True, a lot of ppl will have switched to Macs by now with Logic being
only available on that platform, but I can tell you for A FACT that
most techno music created in the nineties was done with ST's.

Provided you use TOS 2.06 up, *or* some replacement like Magic which
provides the Maddalt() OS call. TOS <2.06 does not handle alternate RAM.

>TT-RAM is a term for TT only !!

TT-RAM is alternate RAM starting at $01000000, which is defined by the
corresponding system variable (forgot the name). Since TOS assumes a fixed
start address of $01000000, this requires a >=68020 CPU.

A ST with PAK030 installed may have TT-RAM.

>This means that Falcon with card on the slot bus to add memory from 4 MB to
>8 or 12 MB cannot be TT-RAM !!
>Why ????
>eh eh because the falcon data bus is 16-bit !!

TOS does not care about the bus width. TOS assumes everything that starts at
$01000000 and works like the TT RAM in a TT as TT-RAM, no matter how it is
connected to the bus.

>Only TT & CT2 / CT60 have TT-RAM = 32-bit ram.
>Sure, this ram can be named Alternative ram too...

Yes. TT-RAM is a special sub-case of alternate RAM. Once it is installed
during system startup, TOS handles both of them the same way, using the same
free memory lists etc.. TT-RAM is always alternate RAM, but alternate RAM is
not automatically TT-RAM.

I don't use my MegaSTE for web or mail anymore but when i did it was with a US Robotics 56K V90 external modem, the only software needed was HS-Modem for the serial issues and the client's eMailer, Fiffi and CAB, so all software was for the Atari platform.

Your corruption might well be due to cabling/termination issues. Have
you tried an external pass-through terminator yet? One curious thing
about SCSI is that what SHOULD happen is not always what DOES happen.
I once had a four item (+ computer) SCSI chain that refused to work
unless termination was on on the first, third, and fourth drives. I
have no idea why (though I suspect one or more drives had faulty
internal terminators), but I used it for several years that way.
Anyhow, the point is to experiment. I've had pretty good luck
ignoring internal termination and just applying a physical passive
pass-through terminator to both ends of the chain.

> Those of you who use your Atari's (not counting the Atari clones, sorry) for
> web surfing. What modems are you using, and which isp's are you using?

I'm using a generic 56K modem (Compaq, actually) and Ultimate
Internet, a local ISP in Southern California. What you need is an ISP
that is able to deal with a text login and a technician that knows
what one is.

If you dial into an ISP with a telecom program (like Flash) you should
see something like "USERNAME:". Upon typing in your username, you
should see something like "PASSWD:". Upon typing in your password,
PPP should automatically connect. (Once you get this working, the
necessary items are put into a configuration file and you don't
routinely type them.) If this isn't the case, your ISP isn't using
PPP with PAP (CHAP isn't supported on Ataris as far as I know).

To summarize, make sure you are using a real modem and not a winmodem.
Then, tell your ISP you want to do a text login using PPP with PAP.
If they say sure, you are ready to go using STing (or possibly STIK2).
If they don't know what you are talking about or refuse to help you,
move on.

If you can't get anyone to help you, one thing you might try is to get
a SLIP account. Not many people use them, but some ISPs still have a
few SLIP customers. Finally, as a last resort, ask if your ISP has
shell accounts available. That doesn't provide graphics, but you can
do email and ftp well enough.

For the record, a quick online search shows ISP.COM in your area for
less than $10/month. Looking over their configuration files, I think
they might meet your requirements (I'm not sure about the PAP/CHAP
issue.) I'm quite confident you will find something, and if you need
help configuring STing, let us know!

So I did just that: CVS version of FreeMiNT 1.16alpha:

rm -rf .compile_040 && time make 040

The resulting real time is 2:05 (i.e. 125 seconds), user time 106 seconds,
system time 16 seconds. This is ARAnyM @ XP 2200+

My Afterburner is currently not plugged anywhere so I can't test the
compiling on it. Perhaps somebody with say CT60 could add their number
here.

>and I don't have a whole lot of it left.

I don't think you can format or re-partition one partition. Diamond Edge
has an "Install boot sector only" feature that might work if that's your
problem (at this point). If you format or repartion then you will loose all
data on the drive!
If the CDROM is terminated then I would suggest that you disconnect the
CDROM (might be bad) and cable until you get your boot problem fixed and
try booting that way.
If still no boot and you can get an auto folder with HDDriver (or ICD)
on a floppy disk then I suggest you boot from the floppy by holding the
Alternate key down as soon as you see the screen light up and hold until
you see or hear action in the floppy drive. If ICD didn't boot from that
procedure (and assuming you have a desktop with Drives A and B) then open
Drive A Auto folder and run ICD. If you can then access the hard drive then
you can transfer, add or eliminate files until you get the right combo
(assuming of course all is not still scrambled).

Hi Sam,

>I'll check for sources here, but I'm not betting on it.
>
>I'm running Magic5 now, and really do want to upgrade to the latest Atari
>version. And I can say that I would be perfectly happy with that.

All you need to do is to get in touch with Atari Workshop, the official
English distributor.
Note that they're the *only* ones who sell MagiC 6.2 revision 3, in fact
the official English version is more up to date then the original German
one. Atari Workshop is the official English distributor for all ASH soft-
ware. So obtaining Jinnee from them is no problem either...

If however, you're updating from a non Atari-Workshop or System Solutions
version, then price wise you'll be better off ordering MagiC and Jinnee
straight from ASH. ASH has good deals for updates and since you own more
then one ASH product you're entitled to the so called Power user prices as
well. The drawback is that ASH only sells the original German versions,
you can turn these into 100% English ones by using the English translation
and/or patch which is available from the DDP website (see sig).

Oh, if you order Jinnee, then may I advice you to opt for the bundle which
includes ASH GemScript... that combination will give you one of the most
powerfull desktops available (Mac, PC and Linux desktops are still playing
catch up).

http://www.atari-workshop.co.uk

Have done a similar thing, pain in the &�� to wire, but works well enough. You could use a 16 meg 72 pin Simm I suppose and build a custom MMU, to map the extra 10MB. Did the Magnum and Frontier boards use a wrap around technique, i.e. they re-mapped the extra ram, above 16meg even though it was in the 4-14 meg space? My memory of this is kinda vague, alcohol abuse ya know;-)

From: Adam Klobukowski <atari@gabo.pl>
Date: Wed, 28 Jan 2004 19:56:49 +0000 (UTC)

Hi Adam,

>Writing a good and compilcated program is a huge task. Most of the Atari
>softwre comes from pre-internet era, when it was not so easy to cooperate
>between developers far from each other, so most of the made their
>software commercial.

I think that's putting it a bit mildly, AFAIK the programmers and even the translators kept in touch with each other by snail mail, a lot of info and contacts got also exchanged at various Atari shows which most of them in that "era" attended. The German programmers received also quite remarkable support from Atari Germany which supported them for a 100%. It's not like all software in those days was commercial either, I've got CD's full here packed with freeware and shareware apps dating from that period.
The commercial programmers were only a small minority really, but they set the standards... standards which until today have only in some very rare cases been met/improved.

>Also the spirit of free software was not so strong as it is today.

That's merely a point of view Adam, I for example don't feel anything from that spirit, TBH I don't really care much for it either. Free software has always been around BTW, it's not like this is something new. What is new however is that thanks to internet, programmers spread all over the world can work on one particular project and interact with each other now.

>They did. MiNT was written by Eric R. Smith who was part of a MiNT
>community for a long time. It was written from scratch without using any
>TOS sourcecode (even when Atari hired Eric to make MiNT beter).

Sure... except that Atari didn't hire him to make it better, they needed the kernel, like always Atari didn't notice what was going on, and when they realised that the new kid in town was called multi-tasking, they desperately needed something to show ... I've been disapointed a lot in Atari-branded software, but MultiTOS was the ultimate crap. Hell, I even had to buy it, it came free with a Falcon, but TT users had to fork out some 120 Euro for it.
At the same period I also updated KAOS (Kromke Andreas Operating System) to MagiX! 1.0, that wasn't much to shout about either, but at least it managed multitasking at a reasonable speed. While MagiX! was developed and improved continuously, nothing much happened with MultiTOS. MagiX! was renamed as MagiC and in that period was the only contender for the title really. I remember attending a computer trade only show in Hannover where

Atari Germany was present, all the TT's and Falcons on show were running
MagiC, if even the largest and most important branch of Atari didn't wanna
know about MultiTOS...
Today, nine years later, MultiTOS has evolved into a pretty impressive OS,
but let's face it, like always on this platform --- too little, too late.
Personally, and I've written this at least a hundred times before, I don't
really care what OS powers the computer, it's the apps running on it that
are important --- and sorry, but IMO Higwire, Teradesk, QED and some of
the other projects others are simply not enough.

Cheers from Belgium
Dennis

Hi Mark,

>Well problem is things break, and you need to replace them. Machines
>most often outlast their perhipherals. How are you going to print with
>no new drivers? How are you going to interact with ms word documents,
>etc

I honestly don't know. I try not to think about this issue all together
TBH. As far as interacting goes with MS crap, TempusWord Ng will come to
the rescue.

>What happens when usenet or smtp protocols change to counter spam?
>Another purpose gone. What about web browsing? Gone with the next
>update. Open stuff at least stems the work.

I'm quite optimistic about this actually, these protocols are a standard,
and standards are here to stay (that's why they're standards). There might
be new protocols introduced, but the original smtp and usenet protocols
IMO are here to stay, despite the spam.

>We can use libxml, freetype, etc. Even apps that are puregem depend
>heavily on free and open stuff, like porthos and freetype,

Some apps depend heavily on free and open stuff, but don't generalize
it, most of the commercial Atari apps don't depend on it at all.

>>Exactly, and that's how it should be in the first place. There's no
>>reason why a decent programmed app shouldn't run perfectly under both
>>OS's. But in my experience, most of the programmers I ever had contact
>>with put MagiC compatibility higher on their priority list.
>>

>Well perhaps. But most of the programmers I know care only about MiNT.
>You and I probably only know a small subset. Some of these coders are
>recluse and hide from everyone ;-) We don't know what their priorities
>are so there's really no way to gauge and that was my point.

You would be surprised how many programmers I know, but read it again, and
it's the main point of this discussion --- I said thay they rank MagiC
compatibility higher, I never said they only care about MagiC. They rank
it higher simply because there are more people using this OS, and they
know this from the feedback they receive.
And yes I agree, some of these programmers are weird and recluse chaps,
but eventually, if they wanna see their work translated in English, they

have to get in touch with me, Peter or Derryck...

>>Well that's in your world :-)
>>In my world however, Atari users don't give a damn about PC's, and they
>>certainly don't use it for nostalgic reasons either.
>>
>
>I'm glad we live in different worlds..It makes me feel better ;-

Let's get a bit deeper into this...
So you are using your Atari's purely for nostalgic reasons? And it's your
believe that almost everyone here who lives in your world admires PC's
and when they wanna relive their youth again, crawl behind their Atari ?
Oh boy!!

>> You realise I hope that there's nothing new under the sun? Back in 1989
>> one could already buy a 68040 upgrade for a MegaST, ethernet cards have

>1989. And back in 1989 I didn't give a shit if I could get true color
>graphics. I was happy with 320x240x16bit..

Well, back in 1989 I *WANTED* a true color card, but it took until 1993
before I could afford one. I remember paying almost $600 for the Nova card
back then, and although this sounds like daylight robbery now, it was a
very good deal -- a bare ATI Mach64 4Mb card in those days costed almost
$450, so for only $150 extra the VME interface and drivers were thrown in.
The VGA 14" multiscan monitor costed another $400, and it was a cheap
brand, similar models from Nec or Sony costed $200 more. You're right it
is a different world now, but let's not forget that these expansions were
created in *that* other world.
It's not like people back then were all ignorant, but the main problem was
the asking price. Atari carried the slogan "power for the price" for
years, but let's face it, except for the ST and STE, all the other stuff
costed a small fortune. The entire Atari community (millions at that time)
started drooling when Atari released the TT, but unfortunately only a very
small minority could afford one... in the late 80's for example upgrading
an ST to 4MB costed $400, and let's not forget what stuff like Megafiles,
laserprinters and some other bits and pieces costed...

>Maybe these upgrades came >too early, or maybe atari should have built
>it into the machine to begin with (that's my opinion).

I agree, Atari should have build them into their machines, or at least
make machines with an open architecture like the PC and more or less the
Mac, IMO it's the main reason why Atari but also Commodore didn't survive.
At a certain point in time, someone needing more then a ST, looking at
what was available back then had realisticly speaking no other choice then
to leave this platform. A full blown spec 486 based PC costed about $2000
in 1994-1995, to upgrade a TT or Falcon to the same specs would have cost
at least twice as much.

>>>150 people who bought the CT60 can't be completely insane.
>>
>>No of course not, but what percentage of Falcon users do these 150
>>people represent? 5%, 10% at most ?
>>
>
>Only god knows. Sometimes I really truely wonder how many people are
>left. I suspect not very many. Maybe 100 programmers MAX and falling.
>Probably 3 users on top of it. It's a scary thing to face, but I don't
>have any reason to suspect otherwise.

Well, according to some statistics there is 1 programmer for every 250
users, if this is more or less correct then there should be some 25.0000
Atari users hiding somewhere...
Here in Belgium (a country the size of a stamp) I know at least 30 active
Atari users, mind you... they're not exactly like us. They use their Atari
for specific tasks like play games, word processing, data base or whatever
really, the whole debate about MagiC-MiNT and the ever dwindling support
has passed them by, most of them still use software from the early '90's,
they don't look for updates -- there are no more dealers anyway, and they
don't even know what a newsgroup is. Now, if there are 30 like these in
Belgium, then there must be 300 like them in Holland & France, and 3000 of
them in Germany & Britain...
Add them all up (the world is quite large) and presto... we might reach
the 25.000 mark easy. The problem of course is that these people although
they still use their Atari's sometimes daily, are not really the future of
this platform. As long as their machine doesn't break down they'll keep on
using it, and when it finally gives up they'll migrate to a PC or Mac.

To estimate how many serious users there are left, the sales numbers of
commercial software IMO is a much better indication. The author of Jinnee
(Manfred Lippert) once told me that some 900 copy's of Jinnee have been
sold (German, English and French together). And let's be realistic, for
every official copy, there are probably 3 "unofficial" copies running.
Copying, sharing, cracking or whatever is a specialty on this platform...
For argument sake let's say that 3000 copies of Jinnee are in use. Not
every Atari user however uses Jinnee, some prefer Thing and others just
stick with the plain TOS desktop. Let's assume that 33% of the users use
Jinnee =====>>> which brings us to the 10.0000 users mark ;-)

I would love to know under what rock all those people are hiding, gee, if only those 900 official Jinnee owners would come forward, I would just like you feel much better about the future of this platform...

>>Do you honestly think that those 150 new 68060 owners will change
>>anything to the situation? 1500 Hades and Milan users weren't enough to
>>change anything to the catch22 situation.
>>
>I was never aware that so many of those machines sold. I thought 20 ;)

A rough estimate is 600 Hades and 900 Milans... for what it's worth there are some 500 MagiCMilan users out there also, meaning that more then 50 % didn't like the standard Milan multitasking OS. But if Milan wouldn't have been so stupid to kill the goose with the golden eggs, then perhaps there would have been 2000 or more Milan users. While the Milan 1 was still in short supply and many people contemplating bying one, they announced the Milan II, which alledgedly would have had more features, a 060 processor, a better software library and the "other" multitasking OS as standard all for the same price... every prospective customer of the Milan I waited of course for the Milan II arriving, well, we all know how that sad story ended :-(
IMO and experience the Milan II debacle was the final nail in the coffin, a lot of desillusioned developers left the platform for what it was, not to mention that some of them (softwarehouses) lost lots of money in the proces as well.

But that paycheck isn't important really, with or without one, you still have to learn what you currently can't. I see it this way: I can play the guitar pretty good (for an amateur), friends and relatives all admire it when I start my thing --- Am I good enough to perform before a public? No way, I know what I can, and I also know my limitations. I'll never be in the Eric Clapton or Jimi Hendrix leage, I'll never be world famous and stinking rich --- but that doesn't mean that I don't enjoy playing on that damn guitar. See the anology with programming... ?

>charge money ;) But I agree.. Things should be at least better than
>they were many years ago.... for sure.

The problem here is that all those commercial programmers who left us are just a name, we don't know the story behind it... they didn't decide on a blue monday: "let's develop something fantastic, charge money for it and get rich quick". Let's take the so-called ASH programmers for example: except perhaps for the author of CAB , what has happened to Sven Kopacz, Manfred Lippert, Jurgen Koneckzny, Christian Witt, Stefan Becker, Dirk Sabiwalsky, Armin Diedering, Thomas Much etc... ? Except for one or two they've all stopped programming all together, it's a fairy tale that they are all developing apps now for the PC or Mac, check it out on Google! Most of these people were students working on their end-theses (I don't really know the correct English expression), Sven Kopacz for example approached a representative of ASH at an Atari show, showing him a very early incarnation of Iconnect... in those days there was only MinTNet which ran a on a not so good MiNT and STiK who only knew the SLIP protocol, and here was that young student with a winsock compatible stacl that could handle PAP, SLIP and even manage dialup connections from ISDN lines... ASH is a software distributor, and like every good distributor always on the lookout for young talent -- they wheeled him in!! And the same more or less applies for all the others as well, some developed impressive freeware that caught ASH's attention etc... but one thing to remember is that they never got rich from it, on the Atari platform software was never sold like on PC or Mac, it helped pay their studies -- remember the times when you were a student? ;-)
But people eventually graduade, find a job, start a family etc... just like programming for you is some kind of hobby, so was it for them, they can't justify the time and hard work involved anymore, and money has very little to do with this. Just like with Audio CD's, it's usally the distributor, the dealers and last but not least the tax office who smile all the way... I don't think that there's one programmer who got rich on this platform, it helped them to aquire new computer stuff at the most.

But hey... let's be optimistic!! Once that their children are a little older and their families are settled, who knows -- they might return back to their first love. One never forgets his first love and also don't forget that they happen to know it inside out.

I ment every word of it... but seeing that I already upset Janez with it,
I probably should have phrased it a little better. Let's say that I view
those "greedy" programmers as the Jimi Hendrix's and Eric Claptons of our
community, but let's face it, Jimi Hendrix is stone dead... one can try to
be as good as he was, and one can aspire to even be better, but without the
talent... no way. Frank, Ozk and Henk are neither stupid nor untalented,
they play in a different leage, that's all. And they have other priorities,
commercial programmers owe it to the softwarehouse/distributor who supports
them to deliver something that will appeal to the *whole* community, so they

will always try to develop software which has mass-appeal. People like Henk,

Frank, Ozk and you are needed also on this platform, but to be blind and not

acknowledge what commercial programmers are able to achieve when they set
their minds on it, well frankly that is stupid...

>it right to begin with, or else they should have left the OS to another
>company. All our extensions that cost money are bullshit, cdrom burner
>supoprt, etc. Bullshit bullshit.

I'm convinced that if Atari would still exist today stuff like NVDI, a
standard Atari stack, and all the necessary drivers would be part of the OS
(MultiTOS ?), but we all overlook that TOS 4.04 is almost 10 years old.
We've moved on in those 10 years, in 1993 cdrom burner support wasn't
implemented because there weren't any available yet, one of thelast things
they've added was SpeedoGDOS, that is hopelessly outdated now, so we all do
our thing with NVDI. If Atari would still be in business, I'm convinced that

SpeedoGDOS would have evolved in something quite remarkable.
As for that CD-R burner support: enjoy it while you can, about the only
manufacturer that still produces SCSI models is Plextor, and it costs a
small fortune, in about a year from now, there won't be any SCSI models at
all available anymore.

>Oooh.. this is a sticky one for me. I use highwire regularly, I can't
>stand cab anymore. What's the point of having forms support if 90% of
>them don't work anyway? Highwire is damn nice in my opinion.

Euh... I never had any issues with forms support with CAB, but then I use the original supplied CAB.OVL from Sven Kopacz written for iConnect. Dan developed a remarkable OVL for CAB under STiNG, but it never was as good as the original IConnect CAB.OVL. But then I'm fed up repeating this really, people just don't wanna know it...

As for Highwire, at the moment it doesn't support the IConnect stack, it knows nothing about OLGA, I need a browser that is minimum an OLGA client, printing is also a problem, it doesn't interact with my other clients, etc. Like I said, *at the moment* it's not good enough, but then who knows what it'll look like in 12 months from now...

>>And that's how I compare software, I don't give a toss if something is

>people probably will. But some day by your own admission, you may be
>hopping the open source bandwagon.. ;-)

Yes, when something appears that has the same (well more) features, as what I'm using at the moment, I will. But right now, we need not to discuss this,

there are no open source apps that come even close. Note that I said apps, not OS... and to be honest, I don't think it will ever happen...

Cheers from Belgium
Dennis

Yeah, I wired a simm under the psu on one of those image, took me like 2 days! Though the PCB version makes life easier, though still some wire, I plan to do a revison, and hey, why not add a few more megs into the ram while im at it, plus a tos upgrade, plus a cpu booster, plus a video adapter, ide adapter, to name bit a few ;-) I didnt fancy building a MMU, it would probably take me the next 10 years to work it out, there are some mods to cut and edit pins around the glue chip which make use of the first 14meg for STram by the looks of things, dunno if it will work or not, only way to find out I gueess :)

it sure is, please see my other post with the exact command line I used.
Or I better repost it here again:

```
cd freemint/sys
rm -rf .compile_040 && time make 040
```

Okay, I replaced all the electrolytics in the power supply. Quite a few
were not working properly. Now, the ST does no longer randomly crash it
seems. However, the above mentioned demo still doesnt work! :) It always
bombs at a particular point (2 bombs, address error) Is it possible that
some demos written for a ST won't work on a STe for some reason? I
thought STe was a proper superset of the ST, but perhaps not.

Yes it is, but as demos often address some hardware functions that
changed (even slightly), some demos don't like STes. This is really
noticeable with demos using video tricks like 'syncscroll' or
'fullscreen' which, roughly, use design flaws of the ST video chipset.
Of course some demos also crashed really nicely on ST/STf...

Cyril.

1094. ST to VGA... Which one ? + SM124

I'd like to connect my old STe to a standard SVGA monitor. Of course I searched the net and found a lot of schematics, but I don't know which one to use. There's one with simple connections between the ST and VGA pins, one with 5 resistors (on R/G/B connections, I guess it's to compensate the difference of luminosity between the three color component) and one a little bit trickier including a transistor. Which one should work best ?

Now I also have a SM124 monitor that is non-working but might be easily repaired (the image is garbled but the CRT looks okay). I don't know how to fix it so if someone living in Paris wants it, contact me.

J'ai un moniteur SM124 qui ne fonctionne plus (problème d'affichage : le balayage n'est pas correct mais le tube a l'air bon). L'électronique a l'air basique mais je suis tout de même incapable de le réparer, alors si vous habitez à Paris (ou pas loin) et que vous le voulez, contactez-moi. (note : j'ai aussi les schémas des circuits récupérés sur le net)

Cyril.

> 16:21:40 Fri Jan 30 Hades060 root

First thing, your 'time' is newer than mine as it shows 2 lines more
of info :) (and I use latest EasyMiNT, IIRC).

Then, the Kronos 1.50 synthetic benchmarks were really not reflecting the
real speed difference, it seems. While Kronos showed 21xfaster CPU,
15xfaster memory and 70xfaster disk (aranym@1700+ to hades60), in real
application aranym@2200+ is just 5xfaster than hades60. So I am glad we
undertook this as it is another step to a demything (just made up a new
english word :) the aranym.

Thanks.

Let me step in a little here: I I (we) ever make impression that i put demo or open souurce or hobby or in one word non comercial infront of commercial programers i should say that that is NOT true. There lies core of the problem. Talent end knowledge doesnt have anything with commercialism... I only want to be treated equaly. Of course, many more of us, hobby programers, are way under level of commercial dudes, or better saying our products are. On other hand, there is a lot of very capable coders arround, even in non commercial sphere, and i just want, that ppl arent blind in this direction as well. IF those apps are as benefitial as commercial ones for platform is totaly different question. U may recall im upset the most, when u star generalising on so big level as its comercial ro non comercial base.. If id have to choose best coder i know (VERY VERY useless thing anyway) it would be from non commercial sphere.. BUT mind u, that dont means those products are now usefull the most, or atari saviour and so on. Stuff like Cubase, Notator, Signum, DynaCadd, Magic and on end MiNT as well are things which did or will make us survive in great scale. The demo scene is vital as well, many routines and techniques developed there saw light in commercial apps, and i do love it, but it is only a part. Demo scenes usualy survives the longest (see vic20 scene, XL/XE scene etc), however thats not what i wish for our platform in general. I will stay with it, and enjoy, surely it is my most liked "corner" of Atari scene, but by fair i wont say its the ONLY branch of it.. I want Atari as platform live as long as possible/ And i think its time, we stop this really useless and at some points, insulting debate, embrace some new steps, even if not enhusiastic and see what happens.

On the contrary, there will be TONS of cheap 2nd hand models for us, well there already are :)

> what it'll look like in 12 months from now...

Well thats perfectly okay. Let me clear something here: I am very happy with HighWire, however thats because of its FAST rendering engine, very nice and fast dithering, already some nice reliabilty on some odd pages. That doesnt mean, however, CAB is bad, or HW better as CAB. CAB is a mature product, ok turning grandpa already, and HW really still lacks proper GUI, forms and about a zillion of things. BUT its engine is very good, caching (CABs prob) great and its growing. After forms will be added, it will be kinda usefull And engine is hardest part... I love some CAB modules, no need i spit HW for lack of them here, i will and i did notify authors. As once already said, some suggestions i had were implemented. Last night on irc i nagged :) author and prob i had was resolved. Lukily it was small bug and did show up since i did a typo, he he.

> happen.

Well again ill point its imho useless debate. Open source may or may not produce better apps as we have them. One day, hypoteticaly, Calamus author may release sources, coders may do changes and voila, better open source application. No need to remind me, its stupid example. Open/Close sources is not who makes things better, any side can do it, but open source allows easier transition to new hardware or patching or anything. No need that open source app is done from scratch. Biggest advantage as i see it is exactly for abandoned platforms. Take PPC clone, noone prolly dont want it, but without apps being translated to PPC flavor, they are useless. So big pallete of great apps we own, will be uselles. If machine is designed to emulate m68k, well then we have MagicMAC/Aranym/Steem already, so whats the fuzz? And we all remember GREAT speed of MAC apps on m68k emulation...

Ill just add that apps which impressed me most lately, with REALY great coding and extrating power from Falcon, are freeware apps. Coding gem's in any respect.. However, may not be usable for every one...

I notice that a lot of british ebay users are offering ST software for sale.
Will this software work on US computers?

When connecting a ST on a standard SVGA, only the monochrome mode is
possible, so RGB signals aren't used (there is a different pin for
monochome signal). If you found schematics indicating resistors on RGB
pins, they are not describing a ST-VGA cable.
The one with direct connection is probably the good one.
This one works fine :
http://ginesj.free.fr/stvga/

Hi Sam F.-

On my Falcon, I'm using a Supra 28.8 modem which I "flashed" an upgrade into so it runs at 33.6 now. Currently I'm receiving at 31, and sending at 28, which is what it's alpha-numeric readout usually says. For newsgroups, email, and ftp, I use Newsie. I have Cab, but it's not too great for surfing :(so I use a Whine-Doze machine for that. My ISP is Foxinternet: www.foxinternet.com I think it's about $15/month if you pay a year in advance. Unlimited access. They cover most of USA, I think. If you want to go with them, I could send you my dial scripts to help get you set up. SOmetimes it can be helpful to use a terminal program to help get your dial scripts set up.

I'm in Seattle. Are you too? I see you're a Seahawks fan. I'm not much into football, and now that I'm a house owner, I have to pay extra taxes for that new @%#$$$ expensive football stadium. @#%!!! Sorry!

-Clayton Murray
Seattle, WA USA

1101. Beta Testers for Tempus-Word NG (English release) wanted!

Newsgroup: comp.sys.atari.st
Date: 2004-01-31 10:59:40 UTC
From: Norbert Simon <spamkiller@no-si.de>
Message-ID: <opr2mzhqy0mldby0@news.individual.de>
Source record: 20888

Tempus-Word NG will be available as an English version in a few days. The first release will be announced as BETA-version. The only reason for that is to check, if all translations, dialogs, etc. are translated correctly, designed well, aso.

The program itself is the same as the German release. Therefore it should be stable and save. With the BETA-Release English translations of the manuals will be available as well (Thanks to Dennis, Derryck and Peter from DDP-Translations for their fabulous support) The manuals will be "BETA", too, because the images are not adopted to the English screenshots yet.

To speed up the final release of TW NG (English), we are looking for BETA testers.

What`s the job?

After release of it, we want you to give us within 14 days a feedback to the BETA versions of the program and the manual. Your impressions, errors you may find, hints, wishes. Your statement shall be a huge ;) e-mail, giving us many informations, to bring TW as close as possible to your personal demands.

Your work will be rewarded by a discount of 30% on the products price (pricing like German version: 100 Euro for TOS, 120 Euro for Windows). Testing is free and without purchase obligation, of course. If this sounds interesting for you, send a mail to info(at)tempus-word.de to get detailed informations how to proceed.

For more details regarding Tempus-Word see:
http://www.tempus-word.de/html/en/index.htm

A 68000 can't access memory "above 16MB", since it only has a 24-bit address
bus.

The MagnumST provides alternate RAM, starting at $00400000.

Some will, some won't. I know for a fact as I remember a US service man in Germany having problems with US games on German TOS. so some games (and of course I can't remember which) check the TOS country code. I am also pretty sure that some don't.....

I'm not aware that you can format just one partition with current Atari
software, that would be a useful feature.

> Man, whatever you can think of folks. I'm starting to pull my hair out

We can redo the test anytime later. I were compiling on HostFS so I am interested in results on real disk (image). Some guys say the HostFS is actually slower than mint's ext2.

> If you really want a compile time with the older kernel I suppose I

Yes, that's what I was talking about all the time but as long as we do the test with CVS updated the same week the results should be perfectly comparable. We don't want to compile something useless, do we? :-)

ISTR that some Quantums, at least, needed parity (or was it initiator ID?) signals. Most hosts and drivers do not provide these.

Which driver are you using? If it's not HDDRIVER, download the demo version and try that. Although commercial, it's by far the best driver available for the Atari, and is still supported.

Hi,
I use a Mega STe(internal HD) for live, and my megafile 30 for sequencing which is integrated into my home studio. It's much easier using this to do the grunt work and then transfer my files over to the Mega Ste. I tried plugging the megafile 30 into the Mega Ste and booting up but the Mega Ste showed only the A and B drive icons, and not C and D drives.

I'm an Atari junkie at heart and have been using them since the 80's for sequencing, just not too hip on the hardware side.
Thanks,
fcr

What? A genlock? Big deal, hardly expensive considering what it allowed you
to do at home where previously it was not possible.

> Stock amigas were as much toys as ST's were.
>

Deluxe paint and Amiga, the program and machine that started a revolution.

Like it or lump it, the Amiga was capable of true multimedia compared to
anything else available for the home and at that price. You could do MIDI on
any computer, but you couldn't do what the Amiga was capable of as a single
solution package on any other home computer.

You don't get a say in that, it is in the history books as clear cut fact.

There is a very simple - but rather expensive ;) way to add Alt-RAM
memory to a ST: use static RAM. Then you need only address-decode/chip-select
circuitry... ;) but the price of 8 to 12MB of static RAM would be quite
unpleasant.

On a more serious note, adding Alt-RAM is much simpler than adding ST-RAM;
a little more than a year ago I built an 8MB Alt-RAM + TOS 2.06 board for
the MegaST expansion slot, using eight 1MB SIMMs a pair of EPROMs and and
about 14 TTL chips. Worked nicely. In retrospective, though, the decision
to use 1MB SIMMs proved to be a bad idea, because they are uncomfortably
power-hungry. Later I built an improved version, with a reduced number of
chips and one 72-pin 8MB SIMM. It is still waiting until I find some time
to test it with an oscilloscope at work before installing. I hope to do it
in the next month or so.

Btw. if one limits oneself to 8MB of Alt-RAM instead of the maximum
possible amount, the circuit can became significantly simpler.

Bbtw. adding TOS 2.06 EPROMs and several megabytes of Alt-RAM immensely
increasesthe usability of a ST-series computer. Multitasking suddenly
becomes a practical option instead of a demonstration, large font caches
can be used, CAB doesn't choke anymore on large web pages, etc.

This is not correct. The monochrome signal from a ST should be supplied
in appropriate proportions to R/G/B inputs of the monitor. That is what
the resistors are for; if you do not use them, you will get a very
bluish-looking monochrome picture on a colour (S)VGA monitor.

Btw. possibly the best picture could be obtained by using a -monochrome-
(S)VGA monitor. In this way one would not see on the screen the moire
effects resulting from the interference of the monochrome patterns and the
CRT shadowmask/pixels.

As far as I know, 2MHz (for the sound chip) and 500kHz (not 200kHz; for the
ACIA chips) do not have to be in sync with the rest of the system.
32MHz, 16MHz, 8MHz and 4MHz have to be.

NO....
Unless you have physically bad sectors.

If it's an IDE drive, avoid formating it!
Some of them have firmware stored on the platter in a way that generic formatting utilities can destroy, thus reqiring factory service to bring it back to life.

Brian

Anyone,
I have been experimenting with different drivers in NVDI for printing under CAB. I have a EPSON Stylus color 880 PRINTER. Is anyone out there using this printer and if so what driver are you using and the settings inside of NVDI. I finally found an Epson Stylus Color 1500 is working quite well and printing under CAB in COLOR is reasonably fast at 720 dpi with the CT60. Just wondering if anyone else is using a different driver that might work just as well and possibly faster yet. Or does the driver not make that much difference anyway???

Thanks for the information,

>>pins, they are not describing a ST-VGA cable.

Another posibility is to get TV tuner (external) prteferably. U need to take care that tuner have RGB inputs and not only composite, if u dont have STE or STxM. Machines without modulators, also dont have composite wired to connector, so has to be RGB in that case, which is better anyway... Serves me nice, and i also can connect many 8bit machines, altough i did frag composite from them...

U really are experienced MIDI user i see. Any machine can do MIDI, but also any machine except ST had sync problems with MIDI. Even to this date ppl go back to STs for pure MIDI things... Altough last few years that does get better. Spare us Amiga ultra capapbility, i know what is it realy capable whren u dont use useless modes like HAM etc.. For Your information in mode similar to HAM ST displays 4096 colors and STE 32K colors, program is called Photochrome. As i said, Amiga had own part of cake (speaking bout Amiga 500 and 1024ST here, 1986 machines...) like GFX. PCM sound, nice hardware for demos/games, ST on other hand had the mono mode. And aps like Calamus, Signum, CAD stuff etc which were eons infront of Amiga apps, and on high res on ultra stable display, i agree it is monochrome tho.. And in MIDI ST are up til today in usage in serious studios, while unmodified Amigas are not in use at all. I will repeat, Amiga is machine with most accelerator boards, A1200 gets accelerators virtualy same days as it came out. There MUST be reason for that, and ultra useability and coolnes and so on, certainly is NOT that reason. And i do own Amigas as well, im not one of those (most of those who start those blames do not OWN and know other machines) who has ever seen other machine. I admit many good facts Amiga had(has) but cant really stand all that bollocks bout ST and other machines. If u really think Amiga was so damn superrios, check Acorn Archimedes, u may be realy surprised...

You are actually lucky. I have a HP 960c andcan only print at 300 dpi in
colour. B&W goes to 600 dpi with NVDI.

>the CT60. Just wondering if anyone else is using a
>different driver that might work just as well and

>much difference anyway???

Magic and NVDI 5 make it possible to print in background. If you add
IPRN2D.PRG to the AUTO folder it will get as fast as it can. My TT does
print just as fast as my pc as soon as it has rendered the print data to
the temp file.

Depends what you want to use the ST for. If it's programs that require high resolution (640*400) such as many music programs, word processors or DTP programs etc, then yes, you are best served the special monochrome Atari monitors (though some of those programs are usable in 4-colour medium resolution as well). I believe there are also adaptors available allowing the use of a VGA/SVGA monitor on an ST, though I have only tried this with a Falcon (where a very old IBM PS/2 monitor worked fine at 640*400).

For games that run usually in 320*200 16-colour low resolution and many other programs (say for painting etc) then some other RGB monitors will do, provided you can source a suitable lead or adapter from the Atari's 13-pin DIN socket.

If the ST is an STM or STFM, it has a modulator in it which would allow you to connect to the antenna socket of a TV tuned to VHF Channel 3 (I think) in the US (or UHF Channel 36 in Europe) but the results would be less sharp than RGB connections.

>Just curious, do people still use Atari ST computers to access the internet?

Yes, I like many do, though admittedly the only really usable program, CAB, is slow with pages that have many graphics. Also, on the ST range you are limited to monochrome in effect (the colour resolutions are too small for comfortable display of most pages) so a Falcon is better. You really need a hard drive for sensible use although in theory it can be run from floppy. Also more memory than the 520 KB of a standard ST is a definite advantage.

>composite out?

You don't say what monitor you are trying to use. Hi rez monitors
cannot work down to the TV scan frequencies used for medium and
low rez, except for some (rare and elderly) multisyncs. Have you
tried feeding composite to a TV?

>I'm assuming the Hi Res circuits are separate from the low/mid res circuits
>(I'm sure I read that somewhere in the past) and if so could I be lucky
>enough to be able to replace a socketed chip to fix the problem?

I don't think so - the Videl chip does it all and can be switched
between various resolutions. In each case the total number of
pixels is 32,000 - that's why you only get 4 colours with 640*320 medium
rez, where there are 16 with 320*200 low rez and 2 with 640*400 hi rez.

>I have extendos pro installed. I have a 2x scsi cd drive. When I boot my
>Falcon, then powerup the cd drive, my data on C:\ gets all screwed up. I don't
>know why.

The CD drive should be switched on *before* you boot the Falcon, as
otherwise the CD driver can't recognize it. Possibly trying to detect
the CD as it's running up causes the corruption?

What CD driver are you using? (You *do* realize that you need one,
normally separate from the hard disk driver?) And is the SCSI chain
properly terminated at physically the *last* device on the chain,
which in your case is the CD? (Even so, I would have expected that
could cause only transmission errors from the CD rather than corrupt
your C:\).

And which hard disk driver? Some, such as AHDI, won't allow a gap in
the ID numbering, so try setting the CD drive to ID 0. The Falcon is
always ID 7 and can't be changed - normally this ID is not used except
for some special purposes, so it doesn't matter (as long as no other
device is set to 7).

>partition, then just copy everything back over to it and viola!

Don't try and reformat it - just zero it. (I don't think you *can*
reformat just one parition anyway!) Incidentally, that's why it's
a good idea to only have a small C: containing the minimum amount
of files that are needed for booting (mine is 50 MB of a 6.4GB
drive - the remaining partitions are ~840 MB).

Hi all,

What does 14 bombs mean? Also, I can't get the Falcon to boot to floppy. Yes, I hold down both 'alt' keyes from the beginning, and I have an Atari Language disk in the drive. Everything was fine until I tried to switch (in Magic) the video to high color. The system seemed to be locked up so, I rebooted the Falcon and...14 bombs. 'Fatal Error In Gemdos: System Halted'. This happens just after Magx booter is loaded. But since I can't seem to boot to floppy, I can't do anything.

A Speed Touch USB ADSL modem which connects to a Draytek Vigor 2200usb Ethernet switcher.

The ST or STacy connects to this using an EtherNEC and STing.

The Falcon connects using a Dynalink Port - SCSI LINK with STing, or if running MiNTNet, I'll pull the EtherNEC from the ST and go that route. I'd love to have MiNTNet drivers for the SCSI Link!

Before that....I used whatever Hayes Compatable modem was handy. The ST can only go as high as 19200 baud without hacks. The Falcon can make use of the 56k modems....some Stock Falcons don't like the highest baud settings when using high-color extended modes, go for the 50k range if you have trouble with the highest port setting.

Brian

That's what I thought. There can't be that many instructions that
have to be emulated. It's surely mostly a matter of emulating the ST
hardware and the 68060 should be fast enough to do this even if a
68040 Milan isn't.

>And aside from speed issues, I have no
>doubt hatari could be modified to run on a ct60 or milan. Now how much

There might be emulators that are easier to port to the Milan, I don't
know much about them. Are there any Milan or CT60 developers who
fancy having a play with the source code ?

It would be fantastic to play ST games on the Milan.

1151. Scripter not running?

Newsgroup: comp.sys.atari.st
Date: 2004-02-01 21:18:01 UTC
From: neil@adel6.freeserve.co.uk
Message-ID: <bvjqe9$oq6$1@news6.svr.pol.co.uk>
Source record: 20839

Help!

I've been trying to get Scripter to work on my computer ever since I bought the program almost a year ago!

I recently got another copy of the program files from Atari Workshop because I thought that my files were corrupted on the original disk. But since I've installed it several times now with no joy I think it is not being installed properly!

I have a Falcon CT2B with Magic 6.20 & jinnee 2.5.

Under Magic 6.20 I installed the program and ALL the files to C:\SCRIPTER\ using the SETUP program. It proceeded to copy all the files, pausing only twice to "check" SCRIPTER.APP (ie for the SCRIPTER.APP in \SCRIPTER and the Magic START folder. Then right at the end of the installation the I got a Magic error - Speicherblock etc repair y/n.

I assume that the SETUP program doesn't complete properly because I tried it again in TOS 7.04 and I got the CT2b red text error at the top of the screen. And also in ordinary Falcon mode (ie switched CT2b OFF) I got 6 bombs after SETUP had supposedly finished.

All the programs and files have been copied to the relevant places BUT when I double click on the VERSION.SIC script in the DEMO folder nothing happens at all other than the script is shown on the screen - ie not executed.

Next I try dragging VERSION.SIC to SICSTART.APP, this tells me the program is running already do I want to Start, Pass or Cancel. Either Start or Pass result in the same action - NOTHING!!

What am I doing wrong? Is there something in jinnee that needs setting up? Or is it SETUP.PRG in which case how do I get another version?

Regards

Neil :-(

> monitor.

Not at all. And I have proof in front of me. :-)

In fact it's the other way round : if you want to use a monochrome
display with a RGB source, you will need the different resitors, because
luminance is a*R+b*G+c*B, not R+G+B.
But with a RGB display, white (or pure gray) is obtained by sending
exactly the same voltage level on R, G and B.
This can be easily seen by looking at RGB signals on the outputs of a ST
or Falcon displaying a white or gray screen with an oscilloscope.

The only worry with direct connection seems to be (I have not checked
that) that the voltage level on the monochrome output is slightly higher
than the standrard max of the RGB input. However, that doesn't seem to
cause any trouble.

Accelerators came out because the Amiga was damn popular and supported,
something that can't be claimed for it's Atari competition at that time.
THAT is saying something.

I admit many good facts Amiga had (has), but really
> cant all that bollocks bout ST and other machines u amiga fans produce.

Both machines catered for different niches equally. People are still using Amigas for video production work, mostly amateur these days, like MIDI on the Atari.

I'd be really surprised to find any software for the Archimedes, or anyone else who uses one in this country. I played around with an A3000 for a while but nothing much of interest there. Nice co-operatively 16 bit OS, but nothing special beneath the pretty exterior. Good educational tool though.

Have you tried cold-booting while holding down Control? This doesn't
boot from floppy, but it will load the Hard Disk Driver and skip all
AUTO programs and ACC's (including MAGXBOOT). This won't solve your
floppy problems, but at least you can get to a usable system.

As for the Fatal Error In Gemdos, I've run into this from time to
time. Usually, if I leave the computer turned off for a minute, it
goes away, although one time I didn't get rid of it until I
re-installed Magic. This is using version 6.01. Haven't had any
trouble recently, though. It's quite rare on my Falcon.

Hope this helps!

Good question....
I haven't found anything that does much in this area.

I finally just got an ST to have around.

You can do so with HDDRUTIL, where you can initialize a particular
partition.
But in any case Sam will have to fix his termination (or whatever)
problem, otherwise it is just a matter of time till his partitions are
damaged again.

> software, that would be a useful feature.

We have to be careful here with what we mean with "formatting". Low level formatting a partition is impossible on any platform since the low level formatting operation cannot be limited to a range of sectors. SCSI drives, for instance, will always work on the whole drive when formatting them. IDE drives support low level formatting of single tracks, but one track may comprise more than one partition (i.e. the end of one and the beginning of another), so again it is impossible to limit low level formatting.
As far as initializing a partition is concerned, just re-partitioning a single partition, some tools for the Atari can do this, e.g. HDDRUTIL.

Normally the Falcon has no ID at all. Only with CD-ROM or hard disk drivers supporting initiator identification the Falcon (and the TT as well) have a SCSI ID of their own. In this case the ID is stored in the Falcon's NVRAM. If there is no ID information in the NVRAM HDDRIVER uses 7 as the default ID, but this is not a feature of TOS or of the Falcon but simply a feature of HDDRIVER.

Thomas Huth an me compiled a version of Hatari for TOS and we tested it
under Aranym. It worked, but when I remember right, it was quite slow,
even with Aranym-JIT enabled (on a 1.4GHz Athlon it might have been have
the speed of a ST. You can see a screenshot here(at the bottom of the page):
http://hatari.sourceforge.net/scrshots.html

It won`t be possible unless you drop the whole CPU-emulation, as you
mentioned already.

Once again, you show a complete lack of research.

The Archimedes had one of the finest score writing (and MIDI)
applications available, Sibelius, which was only ported to Mac and PC
with the demise of Acorn. It also had many applications in video.

BTW - the OS, and the computer/CPU, were both greater than 16-bit. ARM
has always been 32-bit, and the applications use 26-bit whatevertheyares
(registers? God knows. RISC OS is now 32-bit and a few apps are broken
as a result).

The A3000 is contemporary to the 1040ST and Amiga 500. It is
considerably faster than both.

I can hook my STe to my Campaq 17 inch SVGA monitor indirectly
using an old piece of Atari hardware called "Video Key" and a
video converter. It is a little blurry, but readable never the
less. Cannot get monochrome. but color modes work fine.

I tried that and it did not work. I finally heard from Nima and he
suggested something. In the Scanx box there are two buttons, one
on each side of the scanner name. Clicking on both of these by
passes that screen. Doing this, I was able to a little further and
get to the main scannng screen. Almost worked, but still nothing.
It looks like he is going to help me get it working. He is going
to send me a program that will tell him just what the problem is.

Not so, actually, the poor guys were suckered into a deal where I
would produce their track, and then the record company was gonna give
me half their royalties... Which I turned down as an immoral ripoff.
Also because I couldn't 'produce' anything, what's to produce on a
stereo signal...

You should install some kind of boot manager so that you can interrupt the
Auto folder loading easily - it should be the FIRST thing to run, ie before
magxboot.prg.

As it stands you can press both SHIFT keys together as mentioned in the
manual to prevent MagiC from loading and then sort your problems out later.

Instant diagnosis is a missing driver for the res you had selected -
reinstall MagiC and/or NVDI.

> got a Magic error - Speicherblock etc repair y/n.

That doesn't sound good :-(

> All the programs and files have been copied to the relevant places BUT
> when I double click on the VERSION.SIC script in the DEMO folder nothing

Instead, try running the Scripter app and then pointing the resulting file
selector to one of your demo scripts. This will prove or disprove the
successful installation of a major part of the package! You can also drag
and drop a script onto scripter.app.

> What am I doing wrong? Is there something in jinnee that needs setting
> up? Or is it SETUP.PRG in which case how do I get another version?

You need to specify scripter.app as an application to open *.sic files.

Hi!

Have you tried to use 'Options/Install devices' - or whatever it's
called under the Mega STe desktop? The icons won't appear
automatically otherwise.

Once you've got them on the desktop, don't forget to Save desktop so
that they appear the next time!

Hello,

At long last ! it is at last eventually available! ST Magazine issue
132 is the first ST Magazine published in English. You will find here
all the articles published in its French counterpart: CT060, Aranym,
GFA punch, demos, shareware, etc. The colour front and the back covers
leave a huge part to screen captures. The rest is black and white. The
reprography is almost professional quality. You want to order it ? You
just have to send 5 EUR, carriage paid.
more information on http://stmagazine.org

Thanks :-)
Paul CAILLET

1181. Magic & Modula 2

Newsgroup: comp.sys.atari.st
Date: 2004-02-03 00:41:49 UTC
From: leaver@alphalink.com.au
Message-ID: <401eee4d@news.alphalink.com.au>
Source record: 20770

This is a tale which probably is of interest to no-one but me, but I'll tell it anyway.

The first compiler that I purchased for my ST, back in December 1987, was the TDI (in USA) / Modula 2 Ltd (in UK) version of Wirth's own compiler for Modula 2. I have always had a fondness for it, but it didn't become obsessive until I bought an MSTe in 1992 and afterwards installed a 68882 in it.

I purchased FTL M2 from HiSoft because it was supposed to support the FPU, but that turned out to be misleading advertising. It uses the FPU for the MathLib0 functions, but not for ordinary code. I decided to modify the TDI version to use it. That was not very difficult because the floating point support is isolated in the GEMX runtime support module.

However my version to TDI M2 was an early one which had support for 32-bit REALs but not 64 bit. The compiler recognised the LONGREAL type but would not produce code for it. Then John Logan very kindly gave me his later version which did support LONGREALs - up to a point - there was no support for LONGREAL constants, not even in expressions. You had to initialise variables as in

LongReal variable := Real constant;

before using the variable in place of the constant.

My next steps in Atari world were to acquire a Matrix Coco card for the MSTe, and Magic and NVDI to support it. Then I obtained a pre-loved TT and added a Matrix TC card to it.

Alas, my Modula 2 system was not very multi-tasking or video card friendly. Most importantly, to provide error-trapping under TOS, the run-time system grabs every exception vector in sight, plus TRAP #5, #6, and #7. Second, there is a bug in the communication between the OPTION accessory and the other programs which prevents their working together. (I subsequently discovered that our German friends had published a patch for this.) Third, there is a bug in the mechanism for redrawing the screen after the file selector closes which crashes the compiler, linker and editor as soon any window with more than 24 lines is scrolled.

So I set out to see if I could get a system that would run properly on my Ataris under Magic. I started up TT-digger (wonderful program) and made a few discoveries. For example, the compiler was obviously work in progress and contained several undocumented features, such some support for 68020+ and the ability to turn off case-sensitivity and

turn on acceptance of underlines in identifiers. There are some things in the code of the compiler that I still don't understand. I don't know if a later version was ever released.

I now have Modula 2 code for a system that is no longer single-TOS friendly, although It can still produce code for TOS. At present it includes:

A modified and extended version of the TDI OPTION accessory which runs as a program (normally iconified).

The controlling desktop.

The editor, with scrolling problem fixed. The editor is the weakest part of the original system, as it only permits one window. But it handles errors nicely.

The compiler, likewise with scrolling fixed. I've taken out all the vector-grabbing, turned on the 68020 addressing support, added in-line 68020 support for LONGINT/LONGCARD mutiplies and divides, LONGREAL constants and inline 68882 code for the TT, as well as support for a memory-mapped 68882 (note - not a memory-mapped 68881, but that could be fixed - it's just that I don't have one).

The linker - ditto scrolling.

The GEM and standard libraries, including at least those of the modern GEMDOS, AES and VDI extensions that I have used so far.

Enhanced versions of the .SYM and .LNK file decoders. The supplied versions had not kept pace with the supplied compiler, let alone any 68020/FPU stuff.

I'm currently looking at the post-mortem debugger.

The compiler is not the smartest around but it is solid. It happily compiles itself on my 1040 even though you would not want to be in a hurry. No doubt I have introduced more bugs with my fiddling and, as I said, there are still things in the TDI compiler the purpose of which eludes me, but the system seems to work.

I've no idea what the legal status of all this is. The code, apart from the original .DEF files, is all my own but it is produced with much staring at TT-digger disassemblies.

If anyone has an interest in this, feel free to e-mail me directly if not replying on the news-group.

> Will this software work on US computers?

In general, yes. I've purchased a lot of software from Britain and I
haven't had any trouble.

It is possible to create a program that won't sync correctly (50/60
Hz), but syncing software should fix that. In any event, it's not a
common occurance.

Galen

The difference is that now free software is finally hitting comercial software ass. Have you seen free software like OpenOffice back in the 90' (and earlier)?

>>They did. MiNT was written by Eric R. Smith who was part of a MiNT

>like anything. Look at all the Cyber series stuff that is now defunct
>and if you are lucky you might make it run on a Falcon or clone with some
>hack. More than likely won't work at all.

What for a crazy argument is this?
Of course it doesn't run on a Falcon or clone, the Cyber soft series were developed somewhere between 1985-1988, there wasn't a Falcon, TT or clone in sight yet... it's only defunct because you choose to upgrade to a non-compatible computer.

>I sunk loads of money in that stuff over the years.

All you need to do, is to pick up a free ST from somewhere and you'll be able to enjoy your "defunct" software for many years to come. Also reflect back to why you purchased that software in the first place... was there anything that came even close for free available? And is there anything similar available at this very moment (commercial, free or open source)?

>Cyber Paint however is now open source, so what's the rule of thumb here?
>Was commercial, now it's not, so it's no good? Now at least someone can
>fix it right if they so wish to.

NO!! The rule of thumb is that it has a different status now, and that's about it, like many apps that are open source now, it's just lying there idle... nobody cares about it. Instead of at least trying to upgrade some of these great titles of the past, all you guys seem to do, is dream up crazy dreams like porting Open office...

>Also all the money I sank in GFA, got a small fortune in that to with
>many updates and add on packages, and 0 support. They left us with a
>wonderful language, but a somewhat buggy editor.

Well, look at the bright side, at least you are able to use it on a clone and Falcon in contrast to the Cyber series :-)
And remember, no one forced you to buy GFA, every Atari came with ST-Basic (GFA in Germany and the Benelux countries), Omikron Basic or Hisoft basic. I presume you didn't like what was offered *free* to you, and *choose* for something far more better. For almost any application there have always been *free* alternatives available, these alternatives however usally lack features which are present in commercial software, if you want them, then you have to pay for them... if you can do without them, it's free. In a manner of speaking one pays for added value... Buying commercial software was your personal choice, it's plane obvious to everyone that all software

(be it commercial, free or open source) has a limited life span. Do you think MiNT will still be further developed in 20 years from now? Take the anology over to the Cyber series as example (almost 20 years old).

>As for Frank and Ozk these guys make my Hades tick, they provide stuff no >commercial dealer does, along with some other guys of course. ;-)

Good for you... but then I know at least one Hades that ticks away happily without anything on it from them, like you said, it's all perspective...

Cheers from Belgium
Dennis

> by
> Manfred Lippert
> English translation by Joe Connor/TransAction

No, that's not right either... Joe Connor translated the Hyp file and
English manual, the program itself however was translated by Helen Ross,
an anonymous name for most of us. Between 1989 - 1998 however Helen took
care of well over 150 English translations, everything ever published in
English by GFA for example was translated by her, and that's only a minor
example of the great work she done for this platform.
In 1998, she was fed up and switched over to the Mac platform, and ever
since we (DDP) try to fill the gap.

Cheers from Belgium
Dennis

>XF-551 for my XE VGS, but I'll just wait for flea-market specials. He's
>not listing anything for the Falcon, either.

He doesn't list a lot for the TT, Falcon and clones all together, and
that's another reason why I am one of the people objecting to his weekly
"newsletter" here. I don't doubt for a minute that 8bit users can obtain
stuff from him that they've been desperately looking for, but in general
for us the 16bit users he hasn't really got much on offer. He follows
this newsgroup, so he *must* be aware of the difficulties that people
living in the States have to obtain software & hardware for the latest
computers Atari developed. Instead of coming moaning in here how bad
business is, IMO he should start selling stuff that potential customers
want or at least can use.
Not a week passes by here without someone based in the US asking how and
where he can obtain certain software or hardware expansions, it doesn't
take a genius to realise that there is a potential market over there for
a "smart" enterprising person.

Cheers from Belgium
Dennis

From: Janez Valant <swe@atari.org>
Date: Sat, 31 Jan 2004 09:56:09 +0100

Hi Janez,

>I only want coders to be treated equaly. Of course, many more of us,
>hobby programers, are way under level of commercial dudes, or
>better saying our products are. On other hand, there is a lot of very
>capable coders arround, even in non commercial sphere, and i just want,
>that people recognize those coders too, and arent blind in this
>direction as__well.

Look around you, commercialism is everywhere. There are people making
movies, writing books and producing music all around that never ever will
even get mentioned. Is what they produce crap? Of course not, but they've
choosen a different direction and make stuff which isn't popular or
perhaps better put *appreciated* by the larger majority...

>_IF_those_apps_are_as_benefitial_as commercial ones for platform
>is totaly different question.__U_may_recall_im upset the most, when u
>start generalising on so big level as its comercial or non comercial
>base.. If id have to choose best coder i know (VERY VERY useless thing
>anyway) it would be from non commercial sphere..

But this is not about who might or not possibly be the best and possibly
the worst one. It's about surviving... if someone for example develops a
newsreader for this platform, it would be applauded by quite a few people,
if someone develops a new demo, it will be applauded by his colleages from
the scene... to develop that demo might be much more difficult and can
only be made by someone who knows the Atari OS inside out, but it'll only
be appreciated by "insiders". Ten years ago programming something complete
useless is not the same anymore today. Let's assume that there are some
100 programmers left on this platform, well IMO it's a waste of talent.
Not a month passes by without a couple of users jumping the ship, they
jump from the ship because software they find necessary isn't available
for this platform, a platform with no software is no platform, and this is
what's happening here.... the existing software is OK, but getting a bit
long in the tooth.... we need new apps, not demo's... which by the way
most of us can't run anymore, because we haven't got the suitable hardware
anymore :-(

>BUT mind u, that dont means those products are now usefull the most, or
>atari saviour and so on. Stuff like Cubase, Notator, Signum, DynaCadd,
>Magic.. and on end MiNT as well are things which did or will make us
>survive in great scale.

Stop dreaming...
Everything except for MagiC and MiNT which you took as example are reasons why people jump the ship... someone who is really serious about music won't be fiddling around anymore with the Atari versions of Cubase and Notator, Cubase SX and Apple Logic are the new kids in town. Signum no matter how good it is, produces documents which are incompatible with other platforms, not to mention that bitmapped fonts are out... as for DynaCad, if I was an engineer I probably would have loved is some odd 12 years ago, but now there is far more better & advanced available. I fail to see how any of those (once great) products will make us survive.

Be realistic...
I only see Calamus and TempusWord, these are about the only apps that have withstood the test of time, and will keep existing users on this platform for the forseeable future. And coincidence or not, but both these apps carry the commercial status.

>The demo scene is vital as well, many routines and techniques developed
>there saw light in commercial apps, and i do love it, but it is only a
>part.

Yes, that's what happened in the past. Today however it's not happening anymore. You also forgot to mention that these routines and techniques were used by coders who were offered a job by a software house. They've used their talent and the aquired techniques to produce software that was usefull for the overall majority of the users.

>Demo scenes usualy survives the longest (see vic20 scene, XL/XE scene
>etc), however thats not what i wish for our platform in general. I will
>stay with it, and enjoy, surely it is my most liked "corner" of Atari
>scene, but by fair i wont say its the ONLY branch__of_it.

I agree, I don't wanna see that happening either. If something like this would happen then we can't talk about a "platform" anymore either.

>I_want_Atari_as platform live as long as possible/ And i think its time,
>we stop this really useless and at some points, insulting debate, embrace
>some new steps, even if not enhusiastic about them, and see what happens.

I really tried not to insult/upset anyone, but then that's not really possible, there will always be at least some people who feel targetted. The debate however is necessary, because the "new steps" are clearly not working out, they're not really all that new anymore either, all this open source stuff has been discussed here over and over again for at least the last 5 years. And what exactly has come from it? Just name me one title that the overall majority of users use and find necessary... IMO the open source community (scene?) has mostly been developing/porting stuff which benefited themselves. In principal that's OK, but if we really wanna see this platform survive, then thing *must* change. Apps, utilities, drivers etc must be developed/ported which are usefull to the greater part of the users, and if that doesn't happen (soon), then there won't be much left, and the Atari platform may become the Atari scene... about the only program I can think of straight away, that benefited from open source is Aniplayer, just like the

Anodyne CD-Writer suite some parts of it are open source, IMO that's the best

way, porting over open source apps in general doesn't work because the native

Atari hardware lacks the necessary power to run them at a decent speed, but
adopting some routines seems a much more viable option.

>>As for that CD-R burner support: enjoy it while you can, about the only
>>manufacturer that still produces SCSI models is Plextor, and it costs a
>>small fortune, in about a year from now, there won't be any SCSI models
>>at all available anymore.
>
>__On_the_contrary,_there_will_be_TONS_of_cheap_2nd_hand_models_for_us,_wel
>l there already are :)

Ho ho... I haven't got anything against second hand stuff, in fact I use
some myself, but the very last thing I would spend money on is a second
hand CD-writer. CD-writers have a limited life, certainly the older
models, after a certain number of hours being used, the laser weakens too
much, and you'll start producing problematic CD-R's...
I'm not too sure about those "TONS" either, SCSI gear was mainly made for
Apple users, since they aborted SCSI, not a lot is produced anymore. Also
we are limited by the driver restrictions, only certain brands and models
are suitable. last argument: not everyone want to buy & use 2nd hand stuff.

>>Like I said, *at the moment* it's not good enough, but then who knows
>>what it'll look like in 12 months from now...

>proper GUI, forms and about a zillion of things. BUT its engine is very
>good, caching (CABs prob) great and its growing. After forms will be
>added, it will be kinda usefull

Let's not discuss it just now, it's not fair either, it's still beta, so
can't or shouldn't be compared. In a nutshell: I said that I would compare
it once it reaches a true release number and lost its beta status. Needless
to say of course, that I expect it to come with all the (usefull) bells and
whistles that CAB has.
About that engine: The best one (speed and dithering) I've seen so far was
the one used in Wensuite, does anyone know about the status of that app? IIRC
there was a rumour sometime ago that the author would release the sources.

>And engine is hardest part... I love some CAB modules, no need i spit HW
>for lack of them here, i will and i did notify authors. As once already
>said, some suggestions i had were implemented. Last night on irc i nagged

Printing from and saving to are important as well IMO, two features which CAB isn't very good at either BTW. And yes, I also like some of the supplied modules, I presume that it could be possible to get some of them working with Highwire as well?

>>Yes, when something appears that has the same (well more) features, as

>sources is not who makes things better, any side can do it, but open
>source allows easier transition to new hardware or patching or anything.
>No need that open source app is done from scratch. Biggest advantage as i
>see it is exactly__for_abandoned_platforms

But then all you do is serving us some warmed up food from a week old.
Let's assume for example that someone manages to make the cyber series that LP mentioned in a different post run on Falcons, TT's and clones.
Would this then mean that all of a sudden we would see a rise in users?
The cyber series were great at the time, but now they're outdated. What's the use to the larger part of Atari users to make a 20 year old program available again, if no new (important) features are added to it? Cypress is open source also now, it was a great word processor for simple work in its time, if someone would now maintain it, but only make it compatible to run on all Atari's, clones and emulators... well frankly, why and what the hell for?
In 1987 for example I bought the Timeworks DTP package, suppose that this package would now be open source and actively maintained, well, I wouldn't expect it to have the same features as Calamus, but at the very least I would expect it to be able to know colour and use TTF Fonts. That's a stupid example also, I know, but I hope you get to see my drift? Patching that old stuff is nice but you won't keep one single user tied to this platform with it. These apps need a lot of new features added, features which problably will have to be done from scratch.

>Take_PPC_clone,_noone_prolly_dont_want it, but without apps being
>translated to PPC flavor, they are useless. So big pallete of great apps
>we own, will be uselles. If machine is designed to emulate m68k, well
>then we have MagicMAC/Aranym/Steem already, so whats the fuzz?

Well the fuzz is that although the users would be able to use them on that imaginary Atari-PPC clone, the apps would only run faster -- which brings us to why the clones failed on this platform. Certain apps will benefit of course from a bigger speed, but most of them will only benefit a little, I'm tired of repeating it really, we need apps that take advantage of that new hardware, and that means new apps or existing apps with new features. MagiCMac/Aranym/Steem/Gemulator or whatever users have the same dilemma

really, MagiCMac here is roughly 20X faster then a Hades060, so what? If I type a letter in TempusWord under MagiCMac, what are the benefits compared to doing it on a TT? When I print the document it'll be printed a little faster and saving and loading will also be marginally faster, but that's it really. When however I wanna pack/unpack a very large file then I'll notice the difference in power immediately. Both the Hades and Milan their power, graphic card, PCI slots etc are so to speak idle. Because of the small numbers sold, commercial developers don't (can't) support these computers, but why are the freeware and open souce developers turning a blind eye also?

>And we all remember GREAT speed of MAC apps under m68k emulation...

Yes we do, but in the mean time they've moved on, their apps are running natively now. Commercial, shareware, freeware and open-source developers recognised the need for this. And it was necessary, because otherwise there probably wouldn't be an Apple inc. around anymore either. Atari and Commodore are the shiny examples, no matter how good and advanced the hardware is, without software taking advantage of it, there's only way way to go: DOWN !!!

>Ill_just_add_that_app_which_impressed_me_most_lately,_with_REALY_great
>coding and extrating power from Falcon, is freeware. Coding gem in
>any respect. However, may not be usable for every one, which shouldnt
>make it less good.

Yep, since it's for a Falcon only, it's indeed not usable for everyone :-) But then let's not fall over details. I'm convinced that if this platform would be in a different state, then the developer of that app surely would have received a very tempting offer from a software house. And unless that developer has strong principles, he would accept it. Commercial means some advantages also for a developer, he can focus on the development, while others take care of manuals, distribution, support etc...

>After all, even Paprurs is of not much usage to graphicist, etc. And it
>doesnt degrade any of existing great apps out there...

That's true, but Papyrus still is developed further on this platform, on the other hand, I can't recall a graphic app really which is still further developed on this platform. Meaning that the graphicist at some point will be forced to jump ship, the writer however for the time being has no reason to jump ship... It's not really important if an app is of use for a certain group of people, it's important for the survival of the platform that apps from no matter what category see further development, and believe me Janez, I don't really care who undertakes the development, be it commercial, free or open-source, the main thing is that we shouldn't be stuck to what we've got.

Cheers from Belgium
Dennis

Hi Peter,

>ISTR that some Quantums, at least, needed parity (or was it
>initiator ID?) signals. Most hosts and drivers do not provide these.

Yes, every "Fireball" model fits in that category, but the hard disk
however is recognised under HD Driver and can be partitioned, booting from
it however is not possible, so anyone who obtains such a drive can only
use it as secondary hard disk. If being able to boot from it is not a
priority, then don't dismiss the "Fireball" models, they are build to
last, very very silent, and not power hungry at all.

>Which driver are you using? If it's not HDDRIVER, download the
>demo version and try that. Although commercial, it's by far the
>best driver available for the Atari, and is still supported.

I agree, also if HD Driver can't recognise the drive, then it's probably
defect. Like I said, HD Driver has no problems with the Fireballs models
from Quantum (I have two here somewhere).

Cheers from Belgium
Dennis

In the past few days, I've been able to getthe Falcon to see and acces the nec cddrive however, if I re-boot the Falcon, the boot partition gets corrupted again. This cddrive only has 1 cable slot to connect the scsi cable to. And it's got jumbers on the underside of the drive to set the id, which I've set to 5. I also have an apple 600e which extendos pro absolutely does not like as far as I can tell. Shame really as I believe it is the better drive.
There you have it. I'm just about ready to give up on the cddrive issue.

After all this is actually comp.sys.atari.st and not .tt or .falcon. or
whatever! Ben has a lot of ST stuff like games and ST hardware on sale
but very little for "power users" who already have all the old stuff they
want. I'd love to buy from him but have very little interest in games.

>stuff from him that they've been desperately looking for, but in general
>for us the 16bit users he hasn't really got much on offer. He follows

That is not true! I read through his 16 bit catalogue the other night and
there are _lots_ of stuff. Took a couple of hours or so as the list is
not categorised.

I just tried double clicking on SCRIPTER.APP nothing happens no File
selector or anything appears! Click and drag say VERSION.SIC to
SCRIPTER.APP produces the same result!

I have set up SCRIPTER.APP in the jinnee Applications dialog to open
*.sic.

The program mustn't be able to execute itself for some reason, ?corrupted
installation that SETUP doesn't flag instead it just throws a wobbly at
the end of copying the files....:-(

I wonder if I used SETUP.PRG from another ASH program would that work?

Thanks

Neil :-)

Hi rez runs at 71.2 Hz vertical rate, the other two at 50 or 60 Hz
interlaced (50 is used for TV in Europe, 60 in US and Japan etc) since
the Atari was made so that it could be used with TVs as well as
monitors. The computer can be switched between 50 and 60 by software -
some games do it automatically, but there is also a CPX (or ACC?) to
do this.

HDDriver 7.6 detects the Fireballs fine on both my Falcon's just no luck
on the TT, might try the demo version 8 and see if is any better.

Ok Dennis that is it... I honestly thought reasoning with u is possible. But it is not since u are picking smallest possible things, and turn them to call someone a dreamer or whatever. I said APPS LIKE Calamus and similar since they were flagships of Atari in the past, not THE Calamus and similar, meaning, we need new serious, proper apps. New, or existing ones updated. And TW is one of them. And i did said that in context described only one sentence before this dreaming line, sayin that even if i like demos and scene, the REAL (real as usable apps, apps LIKE Calamus..) apps are prospect for our future as platform. What is "dreamy" here? I explicitely say no demos, ports etc will help us, if we dont get new apps LIKE Calamus, Papyrus whatever, aka serious apps. Of course here also fit developin the existing ones, like TW... But u manage to turn something which is supporting u, to something i did not say! U found smallest possible error in text and twist it.. I realy cant and WONT debate anything, if ill have to write explicitly what apps, till last one possible, su u wont find app i forgot (since i talk general, aka: apps LIKE Calamus etc, which are serius apps. So that u wont pick on Calamus, TW is in there, Papyrus, CAB and so on) and call me dreamer and be realistic. If u explain what is wrong with me saying that we NEED usable and serious apps (LIKE Calamus, papyrus, tw2, cab etc) for future, and that those are what this platform need most, ill be all ear. As i see things, only wrong part with this, happens to be that I said that, and im in MiNT/OS camp, so lets blame me.. on something i did NOT say.. So ill stop dreaming u are person capable of discusing... I may agree with you, or i may not, u will find the way to let me know where my position is.. as u divide the positions...

> Yes, that's what happened in the past. Today however it's not happening
> anymore. You also forgot to mention that these routines and techniques
> were used by coders who were offered a job by a software house. They've
> used their talent and the aquired techniques to produce software that was
> usefull for the overall majority of the users.

ACE, year of release 2003. Ah yes, its tracker, so its shit, sorry it dont count. And for gods sake, why u have to be so picky, i only explained my view, aka that i like also the demo scene, and that democoders ARE great coders.. and u already picked that i forgot to mention they have got jobs. Of course many got them, thank god for that, but what im saying in my message was that ALL branches of coders, commercial, demo, games etc have GREAT and not so great coders.. why it has to turn in this... Again, u just cant stand a BIT of diffrent view on things u have...

Im really off from this debate, no use AT all. I mean from all debates in which u participate... If i happen to say what i know u have same view, and u still manage to blame, then its prolly me u cant stand...

Hi again all, just playing with putting a 1.44 mech in a SF314. I seem to recall that you had to make some mods to get it to work as a DSDD and not a SSDD drive? Any ideas? Can anybody remember that far back?

Well don't worry guy's, got my models wrong. Should check more closely
next time. The SF315 was DSDD and the SF354 was SSDD.

Thanks anyway

Mark

I can use Aranym on my Linux system, and its about 110 times faster for GEM apps (with AthlonXP 2500+) than the original Falcon is, according to GEMbench. But I still use my Falcon because MIDI and other stuff work. I have trouble with MIDI on linux, so I use the Falcon to play MIDI and let my Linux system take care of recording multitrack music (24 track 24-bit 96kHz). That way I get the best of both platforms, rather than struggling to get MIDI working in linux (which is awkward to say the least!)...

Oh, and I play Spectrum games on my linux emulator (Alien 8, Sabre Wulf, Jet Set Willy, Underwurlde, and all the old faves!). Those games to me are more enjoyable than Unreal Tournament 2003, and Return To Castle Wolfenstein, which I play the linux versions of...

Hi all,

I currently have my resurrected ST hooked up to a logic analyser and have captured quite a lot of traces of the machine running, mainly around the video / glue customs. I am halfway through re-creating the custom ic's in VHDL (a hardware description language), with the aim of recreating the entire machine (not cpu for now) in an fpga. why ? it means the hardware will be preserved and be customisable. I used to write full overscan, sync scroll demos which I want my clone to run perfectly, so the hardware will have to be cycle accurate.

Just to be fair, I also have a A500 strapped to the analyser and it's next ..

I have completed a vic-20 already as a rehersal.www.fpgaarcade.com. I'll but the timing pics up on the web site next week sometime.

/MikeJ

Hello, a while ago I got an email from Tim Conrardy via Thomas
Raukamp, about a new developer for AudioTracker. The new developer is
Gerhard Knapenski, in Laatzen Germany. The email said that if you
wrote to him and sent some postage he would send a copy of the new
version of AudioTracker. Has anyone actually got a copy from him?
I sent him some money for shipping a while ago but I haven't heard
anything as yet.
I am curious about this new (and free?!!) version of a very cool
program.
Mark

fried.man@sympatico.ca (Mark) wrote in message news:

> I am curious about this new (and free?!!) version of a very cool

Well, actually you need an installed version of AudioTracker to use
the update.
The new program replaces the old one in your AudioTracker-folder,
AudioTracker itself is copyright ny Soundpool.

> program.

Hi!

To ease the process of joining the beta program, some more details:

To get part of it, we need some personal information, to compile your personal beta licence:

- First Name, Last Name, Adress (Street, Town, Country).
- Information about your hardware, you will use for testing.

===> Send your data to: info (at-sign) tempus-word . de <===

(Only mails with complete information an working e-mail adress will be processed.)

With this data we compile your license file for unlimited testing (no restrictions of printout) and - if you want to buy it, it is much easier for us to remember your discount 30% off.

Files will be available (planned) on Sunday, the 8th of February, 2004, 8:00 pm (GMT +1, MEZ). The prepared English pages have moved to http://www.tempus-word.de/en/index.htm (for information and testing purposes).

If you send us your data, we return to you your licence file, including all required links for downloading the program and document files, as soon as you can download them from our web pages.

Note: We respect privacy and grant for using your private data for nothing but this test.

Norbert Simon
Tempus-Word Projekt

Doesn't sound hopeful!

> The program mustn't be able to execute itself for some reason, ?corrupted
> installation that SETUP doesn't flag instead it just throws a wobbly at
> the end of copying the files....:-(

I was guessing that it was barfing over opening the readme, if that's what's
supposed to do. Did it report that it had unpacked the app succesfully?

> I wonder if I used SETUP.PRG from another ASH program would that work?

Only one way to find out, somewhere there will be a specific list of what to
install, external to the prog if you're lucky.

1214. Another overclockable 060 rev!?

Newsgroup: comp.sys.atari.st
Date: 2004-02-05 19:41:28 UTC
From: Mark D <mducksub@nossspamXXatari-source.com>
Message-ID: <pan.2004.02.05.19.41.28.259754@nossspamXXatari-source.com>
Source record: 20653

Hey guys,

Just thought you would like to know that the XC68EC060RC66's being sold on eBay for $15 a piece are revision 4 chips with no MMU and FPU. If the lack of these units doesn't bother you, it's worth noting that my falcon is running overclocked at 92.5MHz with a chip temperature of 42C. I'm going to try for 100MHz later.. I suspect I will be able to maintain reasonable stability. My bus is also overclocked to 25Mhz now and I have one FAST falcon! I suspect the limitations on these chips is temp like the E41J mask and it could be overclocked to 105MHz on a water cooled setup.

Maybe you could try to make the install in plain TOS.

I also remember a problem : if the translated files (config, readme,
etc.) do not have CR/LF ends of line, the setup program may crash (seen
that on a MagiC installation). Check if the ends of line are not either
of the LF ("UNIX") or CR (Mac) type. You can change them easily with
some text editor, for example Qed.

Bye,
/Pascal/

Well i got a apple cd-300 from Digital Dinos and it seems to work ok
(lol well cbhd see's it but still unable to access it from desktop)
external model was just $15.00 plus shipping

There's three different versions of the Atari 1224 monitor, JVC, Samsung,
and Goldstar all made 1224's. I know on mine the volume is on the same dial
as the on/off but the other two models probably have slightly different
controls.

Just something else for you to think about.

Yes, I have one on my CT2B Falcon using STing.

It works great with clients (CAB, FTP, MyMail, ICQ, etc), however, I've not been able to get the servers (http, ftp) to work very well. I haven't spent much time with servers so it's quite possible someone else has had better luck than I running them.

AFAIK there are only drivers for STing. Dan also did some versions for STik he might share if you email about it. None for MiNTnet or MagiCNet that I know of :/

Brian

Hi Sam F.-

I haven't been following this thread, but noticed this posting, and decided to follow up. My Falcon (w/ Nemesis upgrade and 14 megs ram) uses a Yamaha 8x4x24 CR-RW. #CRW8424SX I have Anodyne's CD-Writer Suite. It reads fine, but I'm really embarassed to admit I've never written with it. I have used that unit on my laptop pc to burn CDs with. The SCSI ID switch says "3", altho I think I've had it at other numbers too.

Did you ever get your Falcon on-line? I posted some info about that a few days ago.

Good luck,

-Clayton Murray

Clockmeister <plastered_walrus@hotmail.com> writes

>A few in the UK, but outside of the UK it's nowhere to be found.

You might find Australia is out of the UK :)

>Read "kludge"

The kludge came later. 26-bit is a restriction of the initial ARM chip,
retained as a compatibility mode. Macs had much the same restriction.
The fix isn't even a kludge, a new OS, recompiled applications to make
them 32-bit clean (some existing apps already were), and you have a
stable ROM-based OS. The Iyonix is still an actively marketed and
developed computer :)

>Without software to take advantage, and no proper multitasking.

Ehwhat?! No proper multitasking? Do you know anything about RISC OS at
all? Even the slightest bit? As for the lack of software to take
advantage of the A3000s power, it had vector and rendering apps that
did, and were faster than the Amiga and ST.

>Hurry up, let's have a look.

http://www.dmc12.demon.co.uk/retrotech/ - it's still being updated at
present, so check back. I'm photographing the ABCs. Now, those are a
kludge ;)

Hey Clayton,

Is your Falcon a C-Lab Falcon? Mine is, and it may or may not have a scsi port problem. Wizztronics had for some time awhile back and replaced some parts, and offhand I don't remember which parts they were, but Wizztronics assured me that the scsi port was fine cause they connected a scsi cd drive to it with no problems. Then again, it could be both of my cd drives, The NEC I purchased new bot old, the Apple 600 is used, so I got it for free. Does get power, but Extendos can't find it at all. Ticks me off actually. Oh well.

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

The limitation is from the Revision fab. !!
The thinest it is the better overclock you can use !

For 10$ it is may be a good 060 for those who don't need FPU & PMMU !
But be carefull, the EC has a big bug on the bus interface that makes the
cartridge port of the falcon not running !
No Cubase audio key with EC by exemple !

I don't know if I will get time to solve that because only 3 people use EC,
so....

Are the drivers you refer to from Anodyne Software? I have a
Daynaport, but haven't yet installed it.

Yeah, I did a search too a little while ago. Dennis Vermiere posted
almost exactly a year ago that we should jump on CD-RWs if we wanted
one, because they were drying up fast and boy was he right!

I'm afraid that you'll have to go to the used market. While a Yamaha
8x was actually being sold 15 months ago, there's very few CD-RWs
available for SCSI even on EBay. One good place to try is the low end
Macintoshes. Take a Quadra and steal its drive!

Galen (who thankfully has 2 SCSI CD-R and a SCSI CD, but no SCSI
CD-RWs)

Thanks Galen. It's not like I don't have the cd drives. I have an NEC 25 that ExtenDos Pro will recognize, but when I reboot the Falcon, the boot partition gets way corrupted.

I also have an Apple CD600e, but ExtenDos Pro doen't even find it. It starting to look like I've got 2 dud cd drives.

Hi Sam!

S>Anyone know of where to find used external scsi cd drives?

No, but there's an alternative: You could buy some new ATAPI drive and an ACARD (http://www.acard.com) SCSI-2-IDE-adapter (model AEC-7720U). Not really cheap, but I've got two of these adaptors running with hard drives, and it should work with CD-ROMs and burners as well.

You could also connect an ATAPI drive internally to the IDE port of your Falcon, but this won't fit in the standard case (tower only, stronger PSU required).

With best regards
Ekkehard

Hi Sam,
C-LAB Falcon here with SCSI External Yamaha CD-RW, Toshiba read only
and 2 SCSI hard drives.
After swapping out an old SCSI hard drive with a new one then I had file
copy problems + only one CDROM was recognized. By setting the system id to
7 in Extendos Install app it seems to have cleared up both problems (this
was done after cables were swapped out and terminations were checked) .

Hi All,
First of all thanks to all who gave a shot at trying to help my file copy problem. It seems to be fixed (so far :) I set the system ID in Extendos Install app to 7 (I believe it states it should be automatic if left unset). Hence, I coppied a 150 meg file with no problem. Also, HDDriver FAT/Data cache is now at almost minimum (10/20). With the problem I had to increase it to use over 4 meg RAM (now at around 500k).

Hello Frank,

I discovered that I sent the following directly to you instead of the
group - sorry.
I repost here, correctly adressed to the group :

I downloaded CAT, In2Cat and CATputz, installede and configured the
whole, but couldn't get it to retrieve anything so far.
The group list remains desperately empty, though I filled all the fields
correctly.
My Falcon is connects ADSL via EherNec, and I use MyMail with no
problem.
Did I miss something ?
Could you please help me ? or someone else in this group ?

Thanks in advance,

J.-Luc

Who'd like to use his FalCT60 again for the NGs, instead of this boring OE
;-)

I have a falcon 030, 14 meg of ram. My auto folder contains, sting.prg and sting.inf. I also run xcontrol as an ACC and have sting.cpx, stngport.cpx, and stngprot.cpx active.I have three scsi devices, Hard drive scsi ID 1.0, Daynaport scsi link scsi ID 1.3 and the falcon itself with a scsi ID of 1.7. I am running the latest version of HDDriver 8.1.

The problem I have is when I open up xcontrol and select sting port setup I get 2 bombs and the falcon locks up. Any suggestions would be helpful.

Hallo Jean-Luc!

JL>I downloaded CAT, In2Cat and CATputz, installede and configured the
JL>whole, but couldn't get it to retrieve anything so far. The group list
JL>remains desperately empty, though I filled all the fields correctly.

Are you sure? Did you read and follow my brief english install manual from
Dimitri Junker's site?
(http://www.dimitri-junker.de/software/cat/Cat_Engl/cat_engl.html)

JL>My Falcon is connects ADSL via EherNec, and I use MyMail with no
JL>problem.

Which Stack? STinG, MagiCNet or MiNT-Net? In any case, the internal buffer of
STinG or GlueSTiK has to be set to at least 120kB (ALLOCMEM-line in
default.cfg).

JL>Did I miss something ?

I guess so, as fo me it's working :-)

JL>Could you please help me ? or someone else in this group ?

I'll try my best :-)

The first thing is: Did you call In2Cat by selecting the menu entry
"swap/execute terminal progr." (Tausch/zum Terminalprogramm) in Cat? In2Cat
should open it's window then, and state some "connecting to host" and
associated "receiving data" messages. If it does, and fails somewhere, there
should be evidence in the in2cat.log file as of where the problem is.

The second thing is: Is request of info files (like the grouplist) enabled?
Check the "swap" (Tausch) menu entry "configure infile..." (Infile
konfigurieren), and make sure the first entry "request info-files" (Infodateien
anfordern) is active. If it is, try disabling it, quit this dialogue with okay,
re-enter, enable it, and save settings. Try getting the grouplist again.

If this fails, post the in2cat.log and the infile.txt for further analysis.

With best regards
Ekkehard

Greetings Claude,
What all is in your auto folder?
What order is it in?
Do you use MultiTOS, MagiC, Geneva?

Some things to check...
Make sure the SCSI/Link is terminated since it's last in the chain.
Make sure the SCSI Drivers are enabled in HDDriver.
Experiment with AUTO apps and their order.

In your STing folder...
Disable any STX drivers you don't need to start with.
You'll need the TCP/IP and other 'protocol' modules, and the SCSI/Link driver of course.

One thing to keep in mind about the SCSI/Link STX.
Avoid any access to the Floppy drive when using your Ethernet. Floppy access while STing is enabled with these drivers can sometimes lead to bombs. Once it's working for you...remember to disable STing in the CPX when you need to access the Floppy.

Another thing you might look into is the sting config file in your STing folder. Make sure there aren't any really wild default settings that might lead to crashes, such as not-enough or WAY too much memory being asked for by STing on init.

Disable all CPX but the STing ones at first....
If still no go....
Try having XControl load the general Falcon CPX FIRST...with caches and blitter disabled...then
enabled, etc....

Finally, try reinstalling your STing package and SCSI/Link drivers...in case there's a bad file or something.

Once you get the Falcon booting STing without bombs...selecting the Ethernet CPX should show its proper MAC Address. If you have problems at this stage, come back here and maybe we can offer more info about properly setting the TCP/IP stack and such.

Brian

Very interesting!

They (acard.com) claim that the adaptor also works with CD-RW but only
with certain CD burner programs (Easy CD Creator). Makes me wonder if it
would work with Anodyne's CD Writer Suite?

Normally you can connect two units to an IDE cable but it looks like this
adaptor only support one, right?

If they are not connected to ground, really unconnected, it may be easy to
add the small part of the CT60 schematics and include the two I2C registers
in a very small CPLD on the Milan address bus.

If somebody want to do that, the CT60 schematics are on-line and the I2C
addresses are in the CHG document online too :
www.czuba-tech.com
And for software routs, I think Didier may be ok to furnish them if it is
not already done in the sources of the CT60 software pack !

1256. Falcon RAM Expansion Problem

Newsgroup: comp.sys.atari.st
Date: 2004-02-08 01:38:21 UTC
From: Derek Mark Edding <dreq@earthlink.net>
Message-ID: <hqgVb.16912$GO6.15293@newsread3.news.atl.earthlink.net>
Source record: 20694

Hi Folks,

I dug out my Falcon after a few years hiatus in order to play with CAF, and found that its RAM expansion appears to have died. It's a Personal Computer Systems AB board that takes four 4MB SIMMs. I had to cut a square out of the metal shield for it to fit. It makes the top of the Facon's case bulge slightly.

With the expansion RAM card, the Falcon reboots after about 5 minutes. When I put the old 4MB RAM board back inside, it worked fine. I swapped the two cards a second time just to make certain.

I'm in the market for a new RAM upgrade, unless anyone has an idea of what to try with this one. I did remove all of the SIMMs and put them back in a different order, but this had no affect.

I saw that B&C ComputerVisions sells them, but they did not respond to my email.

Anyone know who still sells them? Is it still possible to get the SIMMs?

Thanks!

-dreq

Since you don't have a CT60, You could probably use my upgrade without
troubles, though I have yet to thoroughly test it with my ct60 now that
it's stable. I'll get back to you if I decide to sell it.

Thanks,
Mark

Hallo Kenneth!

KM>They (acard.com) claim that the adaptor also works with CD-RW but only
KM>with certain CD burner programs (Easy CD Creator). Makes me wonder if
KM>it would work with Anodyne's CD Writer Suite?

I'll have to test it some day, perhaps next weekend. It normally should, as access to the ATAPI-CD-writer is via the SCSIDRV interface anyway, even on the IDE bus, so the hardware interface shouldn't matter.

KM>Normally you can connect two units to an IDE cable but it looks like
KM>this adaptor only support one, right?

The manual says so also (or at least doesn't mention the ability to use two units). The program in the micro controller would have to support it and map the second device to SCSI-ID x, unit 1 or SCSI-ID x+1, unit 0, where the latter would eat up two SCSI-IDs.

There's one unit mentioned that supports connection of two drives, model ARS2120, but it's for UW-SCSI, and there's no indication of the mapping scheme. Any volunteer to test that one (with an narrow-to-wide adaptor) on an atari?

With best regards
Ekkehard

Try http://www.wizztronics.com
They have a 14meg board that takes a single inline 32pin 16meg SIMM. They
likely got a SIMM for it as well.

They should be left open.

For a one-time measurement, it might be easier to just attach a simple
multimeter and do the conversion by hand.

If its been stood for any length of time the Electrolytics have probably thrown a hissy fit, power it up and leave it running for as long as you can and then repeat the test, if that don't work try and borrow a PSU for testing purposes.

It's been a while since I used Sting but I believe you don't need the 3
CPXs installed. It might be the port cpx since Dial.scr should have the
port set to Modem2.
Most important is that you have the correct package of files since thee
were many upgrades and the files don't mix!
Have you tried Stik2?

1266. Second RAM I/F in Falcon?

Newsgroup: comp.sys.atari.st
Date: 2004-02-09 15:38:53 UTC
From: Derek Mark Edding <dreq@earthlink.net>
Message-ID: <hQNVb.17588$jH6.9158@newsread1.news.atl.earthlink.net>
Source record: 20704

Hi Folks,

While I had my Falcon open and was testing its memory expansion, I noticed that there was a second set of identical rows of pins for a memory module a few inches (or several cm) to the left of the populated one.

The two rows of pins occur in the same arrangement as the ones for the populated RAM module. There are a couple of jumpers on the pins in the lower row.

It seems odd that Atari would have designed the falcon to have two separate RAM cards. I don't have a schematic for the beast. Does anyone know what the other set of pins were intended for, if anything?

Thanks.

Note that he is talking about a SCSI Ethernet adaptor where these should
not be needed, but...

A good idea would be to first setup a working serial port connection
anyway. Inactivate the SCSI driver by setting file extension to .STY and
ensure that you only have:

RESOLVE.STX
SERIAL.STX
TCP.STX
UDP.STX

If you still get bombs check that all STinG related files including the
cpx'es are from the latest dist.

You might get the SCSI .STX module working if you change the running
order of the modules.

> Most important is that you have the correct package of files since thee
>were many upgrades and the files don't mix!

Very true.

> Have you tried Stik2?

STiK2 is afaik stricty for modem dialup and not usable.

I use MiNTnet/MagiCnet exclusively and gain STiK support through gluestik now exclusively. Although interesting to configure, it is rock solid reliable and as fast as it gets. That said, I preferred Sting due to the feature set but TBH STiK2 is probably less loaded with bugs and a bit more reliable. Sting just has issues where it doesn't work in many situations for me. For instance, I always had trouble getting sting to link up with pppd on my pc over a serial null modem. Stik2 however had no troubles whatsoever. It's really a matter of choice, but try all of them. You might find that once you pass the initial weirdness of magicnet, the actual setup of the networking parameters involves changing only 3 lines of a config file :)

Thanks,
Mark

I didn't, you're right.
Now that I did, I could retrieve the groups list, I selected the ones I wanted to read, but the groups list (Options / Groups) remains empty except an entry named Private.
If I understood correctly, the selected groups must become checked, but they remain crossed instead. How do I get the groups actived ?

This is called a Proccesor direct expansion, it is literally what its
name is. It allows direct connection to the 68030 CPU. Cards like the
Eaglesonic accelerator, CT2, and CT60 use these connectors. You COULD
wire in further ram, but I don't think you could do it without extra logic.

How about using an Amiga A520 external modulator? Should work in theory.

Mark

I downloaded the latest version of Sting from the Sting website. And now I
have Sting working without any bombs.
But I am still unable to get the SCSIlink.STX to work properly. Beecause I

cannot see the Ethernet0 port in the stngport.cpx.

> Which one is better?

I guess it depends on your needs, and who you talk to. For a simple dial-up only connection, STiK2 (for me, anyway) is much faster. There did seem to be some problems with unexplained crashes with it on my system that no one else could seem to reproduce.

However, if you want to do any kind of networking, STiK2 won't touch it, as far as I can tell. STiNG is your only bet, of the two.

That said, I don't use either. I use MagicNet, because it can work with *all* clients that can run under Magic (whether STiK/STiNG, some MintNet, Draconis, or I-Connect clients). STiK2 was much faster than MagicNet on my system for some reason, but could only run STiK clients. For example, I could listen to an Internet Radio "station" with FalcAmp on STiK, and never once would it loose its connection. Listen to the same thing under MagicNet, and I kept having to wait through buffer refills. STiNG was even worse in that respect, though, for me.

So, if you just want basic dial-up, and only like STiK clients, go for STiK2. Otherwise, I would suggest trying your hand at MagicNet or MintNet, depending on your OS, or STiNG if you are a TOS-only person.

Hallo Jean-Luc!

JL>Now that I did, I could retrieve the groups list, I selected the ones
JL>I wanted to read, but the groups list (Options / Groups) remains empty
JL>except an entry named Private.

This list will be filled only once messages have arrived. The group named
Private is for mail and always there.

JL>If I understood correctly, the selected groups must become checked,
JL>but they remain crossed instead. How do I get the groups actived ?

That's okay, the plus sign indicates that the selection process is under way.

JL>I use STinG, and the Allocmem is set to 128k - I think it would be
JL>enough, wouldn't it ?

Yes, this should be sufficient.

JL>It is - and I could retrieve the groups list. What's next ?

There might be some issue with in2cat's internal group list. File
$\database\in2grup.inf. For me, it failed to init this file properly on the
first run. It should look like this:

#YGB
+de.comp.sys.atari 3493
+fido.ger.atari 411
+ger.atari 1021
+z-netz.rechner.atari.allgemein 1131
+z-netz.rechner.atari.hardware 966
+de.comm.software.mozilla.browser 15908
+de.comm.software.mozilla.misc 10617
+netscape.public.mozilla.unix 9985
+netscape.public.mozilla.calendar 6037

These are the groups in2cat will receive messages from, with the message number
it received last. Quit Cat, edit this file to contain the group names you
selected, add some really high number (65500 or so), and perform a swap. Then,
check the in2cat.log file, where in2cat will indicate the actual latest message
number for each newsgroup. Take that number (minus 50 to retrieve the latest 50
messages, if you like), and insert it at the appropriate line in the above
file. After that, everything should be okay, and in2cat should work perfectly
now.

mit freundlichem Gruï¿½ aus Bubenreuth

The current version is MagiC 6.20, available in English from Atari Workshop
here in the UK - I don't know if they have a distributor in the States, but
that shouldn't stop you. Specify how you would like to recieve the program,
CD or floppy disks.

I also recommend the desktop jinnee, from the same place.

1291. Networking A C-Lab Falcon

Newsgroup: comp.sys.atari.st
Date: 2004-02-10 17:03:52 UTC
From: sf0218@aol.com

Source record: 20728

Falcon/Magic and an athlon/winxp system. I access the web with the pc. I'm thinking of networking my Falcon to the pc, open a web connection with the pc, and then I should (all things considered) be able to launch Highwire and browse my favorite websites.

Now, what I'd like to know is: how can I do this. Keep in mind that this is a C-Lab Falcon, and C-Lab may have messed around with the external scsi port and yacked it up. I say this because I've been having the darnedest time trying to get either of my cd drives recognized and not crashing my boot partition.

I've got Sting and Magicnet. I've got a Farallon unit with a localtalk connector on one end and on the other end a bnc connector and an rj45 connector.

There you have it. I'm ready to listen to all ideas.

Thanks

>cable to. And it's got jumbers on the underside of the drive to set the
>id, which I've set to 5. I also have an apple 600e which extendos pro
>absolutely does not like as far as I can tell.

You've got two issues to solve here...
First of all the termination problem must be fixed, since you can't put an external SCSI terminator on the drive, you'll have to open the case and set a dip switch, look for one which has the abbreviation TERM. That should take care of the termination problem, changing ID's doesn't help because the drive is physically the last one in the chain, and since you can't attach anything else to it...
If you don't want/know how to fiddle with the dip switches, then as last resort open up the Nec case and the Apple case and simply switch the drives around... but remember as long as the termination problem isn't solved, you'll get messed up partitions.

For the time being forget about Extendos pro, I know that there are some people here which are great fans of the program, personally I think it sucks, but try out good old Atari MetaDOS, it should be in your mailbox now. If this recognises your cd-r's then we'll move on and install SPIN! later. SPIN! is every bit as good as Extendos pro, and it's free...

Anyway, the MetaDOS archive contains the following:

-Metados.prg
-Config.sys
-iso9960f.dos
-scsi_cd.bos

Put both the whole lot *including* the config.sys file in your Auto folder and make sure that all the crap which Extendos put on your hard disk is trashed... I've already configured the config.sys file for you, it assumes a CD-R at SCSI ID 5, and will assign itself to the desktop as drive P:

But for god sake, resolve that termination issue first... and then report back, with the good news ;-)

Cheers from Belgium
Dennis

Hi Sam,

>In the past few days, I've been able to getthe Falcon to see and acces the
>nec cddrive however, if I re-boot the Falcon, the boot partition gets
>corrupted again.

You can set the ID number to whatever number that you like, it won't fix the termination problem, you make a common mistake a lot of people make: it's not the hardware with the highest ID number that needs to be terminated, but the drive which is physically the *last* one on the chain. In your case there's only one drive attached, so it *must* be terminated... and whatever you do, as long as it isn't terminated, your boot partition and possibly some others as well will get corrupted.

>This cddrive only has 1 cable slot to connect the scsi cable to. And it's
>got jumbers on the underside of the drive to set the id, which I've set to
>5.

Take a screwdriver and open up the case, pull out the drive and close the TERM switch.... that's all there is to it really.

From: leaver@alphalink.com.au (David Leaver)
Date: 3 Feb 2004 11:41:49 +1100

Hi David,

>This is a tale which probably is of interest to no-one but me, but
>I'll tell it anyway.

Well, It was quite technical and went far above my head, however...

>I purchased FTL M2 from HiSoft because it was supposed to support the
>FPU, but that turned out to be misleading advertising. It uses the FPU
>for the MathLib0 functions, but not for ordinary code. I decided to
>modify the TDI version to use it. That was not very difficult because
>the floating point support is isolated in the GEMX runtime support
>module.

Back in 1997 ASH put ASH MM2 (TDI Modula 2) into the public domain,
that particular version was written by Thomas Tempelhof and Manuel
Chakravarty, it carries the copyright tag ASH, 1987-1996. It works with
MagiC and even MagiCMac, it comes with all the necesarry libs, compiler,
editor etc... somehow I can't help feeling that you've done a lot of
work for nothing, reinventing the wheel so to speak. If I understood it
correctly early versions of MagiC and MagiCMac were created with it. It
also supports the Falcon, the new resolutions of the Falcon and the
DSP. In MagiCMac it supports all the enhanced screen resolutions and
some features of the Mac, CPX modules can also be created with it and it
supports the FPU 68881 & 68882 fully, but like I said it's all very
technical and far above my head ;-)

I've just had a look at it, the compiler is version 4.3e and the editor
is version 2.34, the last amendments were made in may 1996, there's only
one problem: it's completely in German, I always intended to translate
this monster, but somehow never got around to actually doing it. The
archive is almost 12.5 Mb, so even packed expect a very large mail...

It used to be available for download on the ASH BBS, but when it went
down the archive for some reason never made it onto their website. I
have no idea where it could be downloaded from, so.... anyone who wants
it, just mail me... but like I said be prepared to receive a very large
mail ==> 8.5 Mb.

Here's a (quick and dirty translated) overview of what to expect:

ASH, Munich feb 8 1997.
Information about MM2 - a Modula-2 development system for ATARI ST
computers.

The package consists of two parts
(Archive files):

1) The complete code (including all sourcecode)

2) The documentation as SDO files. These are the original documentation
files that came printed on paper with the commercial distribution. To
read and print them, you need the application Signum!2.

Copyright
The MM2 package was developed from 1984 to 1996 by Jï¿½rgen Mï¿½ller, Manuel
Chakravarty and Thomas Tempelmann. Thomas Tempelmann is the holder of
the copyright of the whole package.

The MM2 package is now released as FREEWARE.
This means in particular: The source may be modified and re-compiled.
Any part of this package may be given away at no cost, but I do not
allow anyone to take money for re-distributing any part of this package
without my agreement.
The source code and the documentation is not property of the public
domain. Of course, the included code modules may be used in commercial
products like it was allowed before in the retail version.
<snipped away a whole lot legal blablabla>

All the sources are located in the "S"-folder including the GME, GEP_ED
and various compilers. The sources reflect the last updates/bugfixes as
of june 1996 which were developed for the ATARI ST and all compatible
computers.
Newer versions from i.e GEP_ED and various compilers are located in the
"MAC_PRGS.M2" folder. These versions however were specially written to
be used under MagiCMac and will therefore not run under TOS & MiNT, but
they should work flawlessly under MagiC.
Etc... (some 2400 pages)

Cheers from Belgium
Dennis

>whatever!

Well, excuse me for being that ignorant....
Shall I and all other non-ST users/owners leave here?

>Ben has a lot of ST stuff like games and ST hardware on sale but very
>little for "power users" who already have all the old stuff they want. I'd
>love to buy from him but have very little interest in games.

Yes, and that's what I was trying to say. Undoubtedly there will be people
who will be over the moon with the stuff on sale, but the average user in
this group has very little to choose from...
Take a look at what people based in the US in general ask for here, and then
take a very good look at Ben's enormous list... surely you must notice that
he's some sort of retro-dealer? There's nothing wrong with this, but then I
don't wanna read his complaints about him not selling one single item, a
good computer dealer should first of all look at what his potential
customers want/need and try to play the ball. I.e : I doubt that there will
be a queu with people wanting 1stWord Plus, but if he would offer recent
versions of Papyrus...
You've hit the nail when you said that "power users" already have all the
old stuff, he should try to stock some "new" stuff.

>>stuff from him that they've been desperately looking for, but in general
>>for us the 16bit users he hasn't really got much on offer. He follows
>
>That is not true! I read through his 16 bit catalogue the other night and
>there are _lots_ of stuff. Took a couple of hours or so as the list is
>not categorised.

Fine Kenneth, so then I'm lying!
Well, Anyone based in the US wanting i.e Calamus 2003, Link 97, Ethernet
interface, processor upgrades, ram upgrades, graphic cards, the ASH software
catalogue and a whole lot more of recent stuff, stop bothering us from now
on, and order it directly from Ben, it may not be obvious, but it's all
hidden somewhere in his catalogue.

Cheers from Belgium

Date: Sat, 07 Feb 2004 21:30:15 GMT

Hi Kenneth,

>They (acard.com) claim that the adaptor also works with CD-RW but only
>with certain CD burner programs (Easy CD Creator).

PC and Mac CD burner programs which look specificly for a device on the
SCSI or IDE ports won't work, but it's no issue on Atari at all.

>Makes me wonder if it would work with Anodyne's CD Writer Suite?

I've no idea, but SoundPool's CD Recorder Pro and CD-Lab both have no
problems with it, I've had a Yamaha IDE writer connected to it for a
short time, the only thing that doesn't function is the Safeburn
option, but I presume that this is a software issue...

>Normally you can connect two units to an IDE cable but it looks like
>this adaptor only support one, right?

With a suitable cable you can connect a master and a slave to it, it's
ideal to connect a large (cheap) IDE drive as master and a writer as
slave, since the transfer speed is slow on Atari's (2Mb/sec), it
doesn't make any difference at all, using the writer as slave...
HD Driver has no problems at all recognising Maxtor IDE hard disks, the
app sees it as just another scsi drive... but *never ever* attempt to
format it of course, it remains an IDE device after all...
The Acard AEC7720U costs 62 Euro at the moment, not really cheap, but
then think what a *large* SCSI hard disk will cost you and a writer,
this gizmo pays itself back...

Some two years ago, I've plugged this device here, but no one seemed
even remotely interested in it... the times are changing ;-)

Cheers from Belgium

Hi Galen,

>> My web searches aren't pulling up much.
>>
>Yeah, I did a search too a little while ago. Dennis Vermiere posted
>almost exactly a year ago that we should jump on CD-RWs if we wanted
>one, because they were drying up fast and boy was he right!

I'm really sorry that I was right :-(, but here's a (golden) tip, if you don't mind bying stuff in Europe.

One of the largest Mac dealers in France still has some external Yamaha F1SX SCSI 44/24/44 models in stock (22 to be precisely), this is the last model Yamaha produced, they come in a (very) pretty Yamaha case and are 100% compatible with SoundPool, Anodyne and CD-Lab software. The price is 125 Euro which considering that this is an external drive with cables is rather a bargain... IIRC the F1S is especially geared towards burning music, another unique feature of the drive is that you can burn an image, logo, picture onto the CD, but this however is only possible with PC-or Mac drivers....

The same dealer has an even better deal, but I have absolutely no idea if this writer will work (be recognised) by our software: It's an external Sanyo 24/10/40 writer in a nice case for only 99 Euro.
http://www.macway.com (they accept credit cards and ship worldwide).

Hope this helps a little....

>I'm afraid that you'll have to go to the used market. While a Yamaha
>8x was actually being sold 15 months ago, there's very few CD-RWs
>available for SCSI even on EBay. One good place to try is the low end
>Macintoshes. Take a Quadra and steal its drive!

IMO It's not really advisable to go hunting for cd-writers on the used market, especially the "older" models have a limited life span. After burning a certain number of CD's their laser weakens too much and they'll start producing blank CD's, I presume that's when the previous owner(s) decide it's time to replace it....
Also, a lot of the older writers aren't compatible with the SCSI-3/MMC protocol, Soundpools CD Recorder Pro and Anodyne CD Writer suite both recognise writers using this standard. Another thing to consider is that older writers sometimes have issues extracting for example audio tracks correctly, can't manage multi-session CD's, can't burn in RAW mode etc..

Cheers from Belgium
Dennis

I would forget the Farallon unit and go for a nullmodem connection Falcon
to pc.

There are no such things as "web connections" on the Internet. Mail,
news, web, etc, etc all use the same IP (Internet Protocol).

You could setup the pc to share the connection by using ICS (Internet
Connection Sharing) that should be availble on WinXP too?

Check out http://obooklage.free.fr/Atari/index.htm with a dialup server
for the Falcon and further instructions.

Hi All,
Question for Cubase users:
How much RAM should Cubase 2.06 use with no song loaded and only the file selector module loaded? It eats up 8+ meg on my Falcon!

John

You should post to the group that fits the subject best. In Ben's case
I've _showed_ (*) that c.s.a.st is apropriate.

Quite a few of your posts are imho actually most on-topic in
comp.sys.atari.advocacy and should therefore be posted or FUT'ed there.

>>Ben has a lot of ST stuff like games and ST hardware on sale but very
>>little for "power users" who already have all the old stuff they want. I'd

>Yes, and that's what I was trying to say. Undoubtedly there will be people
>who will be over the moon with the stuff on sale, but the average user in
>this group has very little to choose from...

But the average 16-bit retrogamer in this group will!

>You've hit the nail when you said that "power users" already have all the
>old stuff, he should try to stock some "new" stuff.

It's up to Ben alone if he likes to sell old or new stuff. It's up to his
customers do decide if the want to buy from him.

>>>stuff from him that they've been desperately looking for, but in general
>>>for us the 16bit users he hasn't really got much on offer. He follows
>>
>>That is not true! I read through his 16 bit catalogue the other night and
>>there are _lots_ of stuff. Took a couple of hours or so as the list is
>>not categorised.
>
>Fine Kenneth, so then I'm lying!

Unfortunately you are. Proven by the fact that: If someone wants do buy a
16-bit 520ST and some 16-bit ST games Ben has it all in stock.

>Well, Anyone based in the US wanting i.e Calamus 2003, Link 97, Ethernet
>interface, processor upgrades, ram upgrades, graphic cards, the ASH software
>catalogue and a whole lot more of recent stuff, stop bothering us from now
>on, and order it directly from Ben, it may not be obvious, but it's all
>hidden somewhere in his catalogue.

Yet another false statement!

(*)
1. What should or should not be posted to a particular newsgroup is
regulated in the group charter.

2. If a newsgroup lacks charter (as c.s.a.st does) general usenet
netiquette apply.

3. RFC1855 does only "forbid" ads that are:
a. otherwice off-topic (Ex. Amiga ads => off-topic; AtariST ads =>
on-topic).

b. spammed or sent to often.

c. against the majority of the "group member's" wishes.

You want to connect a crashing Falcon to a peecee???

C-LAB "messed around"? My C-LAB recognizes 4 SCSI devices
in the chain (2 hard drives, a CDROM R/W and a CDROM Read only). Have you
tried all the suggestions that were given to you?

>I've got Sting and Magicnet. I've got a Farallon unit with a localtalk

My idea for you is to forget about it until you fix the Falcon crash
problem! Check that the last device in the physical chain is
terminated, cables are good, ID settings are correct and Extendos is
configured correctly!!!

Dennis,

Thanks for your response. I may have done a lot of work which is of no particular value other than education for me, but I did check what was around before I jumped in. I have Megamax Modula 2 and the version numbers seem to correspond to those that you quote. I had a go at using it and while it seemed impressive, my lack of German made it very difficult to employ.

But what is its relationship to TDI Modula? If it is a descendant, there has been some heavy plastic surgery. The desktop is completely different. That doesn't prove much, but it does seem odd that anyone upgrading a system would bother to change the file extenders on source code. MM2 uses .D for Definition Modules, .I for Implememtation Modules and .M for stand-alone Modules whereas TDI used .DEF, .MOD and .MOD - the TDI compiler is "smart" enough to distinguish between the latter two.

Further, the copyright dates that you quote suggest that MM2 and TDI are separate entities.

But you have inspired me to have another look at MM2.

I did not follow the whole thread, and that's why I'd like to ask: What
do you mean with "accessing both at the same time"? Note that when two
SCSI drives have identical IDs or one drive has the same ID as the
computer's initiator ID (which is not allowed) strange effects can be
the result, e.g. the same devices responding to any ID etc.
Always ensure that your setup is SCSI-compliant!

Yes and no. You have to be careful as the version numbers are confusing.
Cubase Score 2 is in fact the same as Cubase 3 but with less scoring
functions.

The _older_ Cubase 2 (no Audio or Score) dongle vill not work with Cubase
3.

We are talking about an IDE to SCSI converter. I was wondering what would
happen with two IDE units on the IDE bus.

My guess is that the converter must respond to two separate ID's on the
SCSI side for this to be possible?

(Asuming the converter supports two IDE units)

No.

V2 dongle only works with V2.

V3 dongle only works with V3 and Score 2.

Score 2 is the later improved V3 with a better score module.

I use it.

In stock.

The converter must ensure that each unit visible on the SCSI bus has its unique ID, either by using different device IDs or by emulating a single device with two LUNs (Logical Units). Or by managing the two IDE drives in a way that a single SCSI drive with the total capacity of the two IDE drives is available.

I did try a HP Laserjet 1200 with my Stacy and nothing printed. The
computer acted as if data got sent to the printer but the printer itself
remained silent.

Switched to HP Laserjet 5 and all was fine.
Gemulator (on pc) prints fine on the 1200 printer!

All with NVDI 5

With NVDI 4 under Gemulator some printouts managed to crash the printer
with paper jams! Switched to NVDI 5 and it worked, weird...

Hi all,

Nothing to do with Atari computers, but I thought you might enjoy this.

If you know your Gilbert and Sullivan Operas, you'll enjoy it even more
(because then you'll know the tune and be able to sing it !)

..and no - I didn't write it :-)

I am the very model of a Newsgroup Personality
I intersperse obscenity with tedious banality.
Addresses I have plenty of, both genuine and ghosted to,
On all the countless newsgroups that my drivel is cross-posted to.

Your bandwidth I will fritter with my whining and my snivelling,
And you're the one who pays the bill downloading all my drivelling.
My enemies are numerous, and no one would be blaming you
For cracking my head open after I've been rudely flaming you.

I hate to lose an argument (by now I should be used to it).
I wouldn't know a valid point if I was introduced to it.
My learning is extensive but consists of mindless trivia,
Designed to fan my ego, which is larger than Bolivia.

The comments that I vomit forth, disguised as jest and drollery,
Are really just an exercise in unremitting trollery.
I say I'm frank and forthright, but that's merely lies and vanity,
The gibberings of one who's at the limit of his sanity.

If only I could get a life, as many people tell me to;
If only mum could find a circus freak-show she could sell me to;
If I go off to Zanzibar to paint the local scenery;
If I lose all my fingers in a mishap with machinery;

If I survive to forty, which is somewhat problematical;
If what I post was more mature, or slightly more grammatical;
If I could learn to spell a bit, and maybe even punctuate;
Would I still be the loathsome and objectionable punk you hate?

But while I have this tiresome urge to prance around and show my face,
It simply isn't safe for normal people here in cyberspace.
To stick me in Old Sparky and turn on the electricity
Would be a fitting punishment for my egocentricity.

I always have the last word; so, with utmost finality,
That's all from me, the model of a Newsgroup Personality.

Hi guys,

Those of you who were part of the Atari demo scene in or around 1990 will probably like to know that the "ST NEWS International Christmas Coding Convention" 1990 VHS video has been transferred and properly edited for transfer to DVD. A release date is set for Easter and it will probably have its premiere at the Outline 2004 Party in Lievelde, Netherlands.
With the use of current-day digital technology, the DVD finally looks like the way we wanted the VHS version to look. It is truly "The Director's Cut".
Check out www.stniccc.com and follow the link to the DVD news item for more information and a 6.8 Mb 1'16" downloadable promo clip.

Interesting that you asked...

The last printer I know of under $300US that can be used on an Atari is the Brother HL1440 laser, which happens to be under $150. It is destined to be closed out soon.

If your pockets are deeper, any printer that can emulate Epson FX, PCL3, PCL4, PCL5, or PCL5e can be used with NVDI. Several such printers exist. However, they are "business" models that retain the backwards compatibility in order to allow for a business's "critical applications" to continue to function. Most such printers are over $500.

Hmmm, interesting. Is the printer listed as being a PCL5e printer?
he HP Laserjet 1300 is listed as being DOS compatible and able to
emulate PCL5e, so I'd suspect the 1300 could be used with NVDI. I
haven't verified this, however.

I suspect it can't unless under emulation. My guess is the printer
depends on a pc bidirectional printerport to function. But note that I
used the Win2000 Laserjet 6 printer driver!

Hi Nick,

I'm not exactly sure what you are in need of.

I've got, like 3 nonworking (1 works but flaky) Atari ST
hard drive systems. If I recall correctly, there are 2
different "converters" needed, to goto SCSI. I believe
one is called a "host adapter", and the other one converts
from something like "non standard SCSI" to regular SCSI.

I hope someone will post corretions, where applicable...

Hi, I'm Ben Smith, proprietor of Bravo Sierra Computers! I'm an Atari Dealer/Reseller who occupies a unique niche in the Atari World! Most Atari Dealers stick to just selling NEW, I also sell Used/2nd Hand Atari Goods! So not only do I sell NEW Atari Goods at a competitive price, I also sell used Atari Goods you may not be able to find anymore at Swap Meets, Thrift Stores or even Auctions Sites! And I sell for less! And unlike those who will remain anonymous! I test Goods before I sell them. So not only can I sell you some Great New stuff! But I can sell you hard to find 2nd Hand Goods, partly because I'm the guy most people come to when they want to give their Ataris a New Home! I'm saving Orphaned Atari's from Oblivion! Goto http://BensCatalogs.Atari.org or Call (503)256-9974! I'm not asking a lot, I'm just trying to make a living and I'd like to earn your Business!

Well, the ST, by design can only produce 5-bit digital audio.
You could convert the files into a suitable format however, and
get sound similiar to that of an AM radio with a slight amount
of "static" (distortion).

I don't think you'd be happy with the results, but not sure.

1364. ST to VGA

Newsgroup: comp.sys.atari.st
Date: 2004-02-12 11:46:09 UTC
From: exxos <chris@home.co.uk>
Message-ID: <402b6778$0$6849$cc9e4d1f@news.dial.pipex.com>
Source record: 20552

Hi all,

I'm working on a pal to vga converter for another project and I realised that with little work it would convert the ST video into VGA to use on a normal PC monitor. This type of thing is a scan doubler since it will in effect put a X2 type zoom on the video to fit onto a VGA screen, I'm waiting for my test board to arrive though im sure it would work great for the Atari to VGA. It should take RGB or composite PAL/NTSC and will be updatable via flash eeprom. Would there be any interest in the Atari scene for this board ? It wouldn't take much work to adapt my current design to do this so if there is enough call for it then I will bring out a ST to VGA converter. It is a beast of a project though my test board should be here soon, from then I could adapt for the ST. Note that this will be for the colour resolutions not just mono like other adapters!

Cheers,
Chris

If you're just talking hi res mono, been there, got that.

If you're talking low and medium colour on a PC SVGA then there may be a
demand, I certainly get regular enquiries for colour monitors.

Any one else?

Theres a few adapters floating around for mono, but im talking low and med
res, I have a mono and colour ST monitor in the loft not being used, though
I simply dont have room for them on my desk, which is half why I thought of
a converter board adaption for the ST. It depends on demand, building 10
units of something is a expensive route, some of the manufactures of the
devices I use only sells in qty's of 2000, needless to say you get a good
price on parts but I doubt there would be 2000 willing Atari users, in fact
the board is intended for any low res to high res converter so it would also
work with games consoles I'd imagine such as the playstation etc.

Claude,

You mention Sting loads the module.. but does HD Driver see the
DaynaPort on boot?

When I first installed the DaynaPort that was my main problem, getting
HD Driver working with the Daynaport.

After I had the HD Driver issues resolved, it was getting the
Route.Tab setup to see the gateway. I tried for weeks playing with the
file with no luck. I ended up installing a proxy server on my linux
box so my TT could get on the web.

On the other hand, I was also lucky enough to beta test the Stik 2
version of the Daynaport drivers. It worked much better IMHO when it
came to setting up the network and seemed a bit faster. The problem,
it's unstable and would crash on me in the middle of data transfer,
freezing CrAB and the TT. I don't have the latest version, but I know
that the developer's version was working much better when I last
talked to him about it.

Hello All,

Can't really make up my mind. Now considering installing Mint. What are the advantages (if any) of a Mint setup over a Magic 6.x setup? And what does a typically basic Mint setup consist of? And would I still be able to run the software I'm currently under Magic, I.E. Atariworks, Pagestream, Aniplayer, etc.?

Thanks

Hi,

> Can't really make up my mind. Now considering installing Mint. What are the
> advantages (if any) of a Mint setup over a Magic 6.x setup?

You can't compare MiNT and MagiC because MagiC is a complete OS and MiNT
not (it's only a kernel).

If you want to know what's the main advantage to use MiNT (with the
'add-on'), I will respond you: THE STABILITY.

On Falcon, MiNT is solid like a rock; MagiC is more buggy.. specialy with
DSP app.

Nevertheless, Magic has a big advantage.. his AES!

This one is very good again NAES (I don't speak about XAAES).

> And what does a
> typically basic Mint setup consist of?

With MiNT, you need NAES, NVDI/fVDI and a good desktop like Jinnee to make
it usable.

If you want to use MiNT with XAAES/teradesk, I can only say one thing:
Remain on MagiC !

XAAES is too slow and teradesk limited for use it confortably.

> And would I still be able to run the
> software I'm currently under Magic, I.E. Atariworks, Pagestream, Aniplayer,
> etc.?

almost.

Some little app doesn't work on MiNT. This one are generally
ASH's application like iConnect and OS extention like menu3D, steward, etc
etc.

Personaly, I use the both OS but I prefer MiNT without any hesitation.

In most case, MagiC and MiNT have "the same" look and feel with common
application, specialy if you use the same desktop.

The main difference are the windows's widget and some AES object.

but if you want to see yourself:

http://zorro.arcadia-crew.com/gfx/Capture1.png

It's a screenshot of MiNT+NAES+JINNEE on my CT60 (I own a Eclipse). The
application on the front is the futur USB CAM -> CT60 manager.

The last MagiC version is 6,20 and the major improvments again 5,x are
shared libraries, pipe, and more posix support.

Some app like aniplayer take advantage from it.

I used to run Cubase Audio 2.04 on a 4Mb Falcon on a completely clean
system (just TOS, no AUTO or ACC programs). I ran out of memory doing
a huge scoring project, and quickly upgraded to 14Mb, and later to
version 2.06. But since it worked in less than 4 megabytes (barely),
it shouldn't be taking up 8Mb, unless you have other things running,
or have all of the modules set to "Active" and "Preload" (I think that
keeps them all resident in memory at all times). Even at that, though,
you shouldn't be eating up 8Mb, I wouldn't think.

Well desktop look is not exactly good point for deciding fo OS. Both,
Magic or MiNT can run Jinnee or Thing desktops, and main difference are
just in widgets... Also usability or feeling is same and same applications
run on both... Differences are in other areas..

Well mine desktop (MiNT+N.AES+Thing desktop) look like this:

http://yescrew.atari.org/swe/swedesk.jpg

Nothing fancy, just my work desktop, didnt want to make special snapshot
wich looks cute. XClock however is Xwindows application, which run on
remote PC/Linux machine, with display redirected on Falcon.

Would you say that Thing is better than Jinee? I'm asking because I simply don't know and can't afford to buy and try. That is to say, as opposed to buy and use/keep.

Thanks

Do a Google search for "I am the very model of a modern Major General" by Gilbert and Sullivan. That should find you a MIDI file of the original tune.

Cheers

> Aniplayer, etc.?

Both have pros and contras. Main difference as i see it, is that Magic
is complete OS replacement, and introduce own AES as well. MiNT is
technicaly just an TOS extension. But its very flexible and thus allow
diferent AESes to be used, diferent filesystems, Unix shells, unix
networking stacks and so on. In short: Magic is small, fast and monolytic,
u cant change it... MiNT is very flexible, can be used in few ways, either
as kernel/AES only setup or as kernel,unix and AES setup, in which u can
use unix shells and resources together with AES/GEM (N.AES or XAAES)
desktop. But typical kernel/AES only setup offer similar usability as
Magic, is a tad slower and use more RAM, but its very stable. Unix setup
offers unix apps and shells as well, next to all what Magic or TOS can
offer, GEM apps can also use unix resources, but RAM usage goes up a lot
(14mb is VERY tight) and also it consumes quite a lot of HDD space, some
0.5 gig is recomended for realy comfortable work, altough it can be
installed on lot less...

If u need GEM apps only, no Unix etc, and have 14mb or less, go for
Magic... Both OS-es will run all apps, except some OS binded tools etc, but
as said, Magioc require less RAM and hdd space...

Hi,

It might be easier for me if you could list a few of the 8bit items that you would be willing to trade for.. I have several Atari hard drives for the ST line one of them is a Megfile the other is a good scsi drive with and ICD scsi adapter, and one from Berkley Microsystems.. I am mostly doing hobby and recreational electronics projects with the 8bit line of Atari products.. Most Syquest cartridge Scsi drive will be seen with the ICD scsi adapter and HDdriver 7.6 and higher.. I also use PLI floptical drive and disks with the ICD adapter..

Regards,

Hi, and thanks for your reply and interest!

First, I have not tested any of these items in a few
years, but I can, and expect them to work
perfectly, based on the fact that they worked when
stored away, and the care I took in storing them.

I also may want to keep at least 1 complete 8bit
system, so, offhand I could part with:

400 800XL 810 1050 1010 1030 indus-GT

I can perform a more detailed inventory, if needed

I would say the fact that you can run bash, apache, openssh, and a lot
of other open source *nix packages ported to MiNT.

See http://sparemint.atariforge.net/sparemint/html/packages.html for a
list.

I've checked him out already, hes selling everything he has including
20cases and 8 ataris, plus other bits, I'd like to get this lot but I really
dont have room! I suppose as a last resort I could make a bid and get the
lot, and try to sell bits on, though I dont have a lot of time at the
moment, plus I have about 10 Ataris which im in the middle of upgrading to
sell so I wouldn't be able to move for stuff!

If you buy N.AES, there is a registered version of Thing that comes with it.
Note, this particular version of Thing only works under N.AES.

I haven't tried Jinee...
Thing is quite good, and there is a free demo.

Note: When I speak of "MiNT", I am refering to a complete SpareMint or KEMD
setup.

I have a CT2B on my Falcon funning at 50mhz....with plenty of extra RAM on
board...so,
My favorite thing about MiNT under N.AES is the nice color TOSWIN and the
ability to pipe stuff into this somewhat vt52/vt100 compliant window (It's not a
perfect emulation yet, but it's about the best there is for TOS that can look
and act like a proper tty to a variety of shells). The presence of ncurses,
compilers, and libraries allow me to compile things like muds, mucks, talkers,
and clients for these such as tiny-fuge. MiNT-net allows me to put these
servers and clients on-line rather easily. There are slews of ncurses based
applications avilable on the sparemint site in binary form (telnet, http, ftp,
ssh, servers and clients for instance), or in sources that will often compile
straight away. If these things sound attractive to you....MiNT is definately
the way to go. Esp if you have upclocked your Falcon and added extended memory
somehow.

In contrast...
MagiC, on a stock 14meg Falcon is gonna be a lot zippier. There are alot of
things MagiC just does FASTER than MiNT+AES. For instance...you'll run into an
occasional application that under Mint, will have over a second delay between
the striking of a key, and the onscreen display of said character....the same
app under MagiC is peppy and responsive. Sometimes tinkering with time-slice
and process priority under MiNT will even things out...but sometimes it doesn't.

MagiC is a no brainer to set-up and start using, where MiNT will have a bit of a
learning curve to get up and running, and even more to get it tuned and
responsive to your liking.

On my setup, I've found that MagiC is a little more tolerant to Accessaries, CPX modules, and TSR (auto folder) utilities. If you're really keen on sets of these type utilities...in general, they'll behave better with MagiC. As MiNT evolves, the keepers of the code, with good reason intend to make it a more proper multi-tasking environment that will eventually do away with the use of TSR and ACC type applications altogether. For this reason, and some others....if you have suites of ACC and TSR based apps that you're really fond of, and don't come in more properly coded variants....MagiC just might be better for you at this time.

Drawbacks to MagiC...
The emulation window with TOS is a vt52 console only, and offers no ansi color support. It doesn't have the suites of free compilers and libraries for multitudes of languages that you'll find with MiNT....so compiling your favorite posix compliant apps with little or no effort is out. There is no multi-user ncurses based environment that I know of.

In short:
MiNT opens up an entire new universe of code and applications for your Atari, but it comes at a price...1. Slower, 2. Needs more memory and drive space. 3. Learning curve, time, and paitence to get your setup tuned just right to your personal prefs.

MagiC is fast and easy to install and use. It manages memory quite efficently, and will behave a little better with so called 'legacy apps', ACCs, and TSR utilities. MagiC has a really nice asthetic look and feel right out of the box, that will take alot of time fiddling to achieve with MiNT+AES. This is better for the install and go user with an unmodified Falcon in my opinion.

With all that said....
I highly recommend you tinker with BOTH if you are finding enjoyment experimenting with your Falcon. There is enough to MiNT that is absolutely free! Install it and see if the world it opens to you is an interesting enough one to invest in N.AES. There's nothing to loose other than time, and a HD partition dedicated to an EasyMiNT install (no loss if you end up using it, and easy to reclaim if you don't :).

Brian

>snip< what does a
> typically basic Mint setup consist of?

Basic setup is simple:
MiNT kernel in auto folder.
a MiNT or MULTITOS folder with text based setup-file(s) and your AES (4.1 or XXAES are free, N.AES commercial).
Also in the MiNT/MULTITOS folder you'll put various modules to drive devices, add consoles, sockets, etc....

An Optional Desktop

AES 4.1 has a desk-top built in, but it's rather basic, kinda slow, and doesn't support long file names as supported (optional) via the later MiNT kernels. An alternate desk-top can be loaded with this AES if you wish....all in all....XXAES is the better choice in my opinion.

XXAES is seperate from any kind of desk top. TaraDesk is the defacto standard 'free' desk top atm, but of course you can use Thing or Jinee...and take advange of long file names. NeoDesk and Ease are likely to work as well, but then you're back to more primitive AV-Servers and no long filenames.

N.AES is a commercial option. It comes with an N.AES only, registered version of the Thing desktop. Quite good!

It is possible to install MiNT-net as part of a basic set-up; however, it's highly recommended to go ahead and add an ext2 or minix partition, and lay down the whole kit and kaboodle. It's just worth the time and headache you'll save to go ahead and install EasyMint in entirety ;)

> And would I still be able to run the
> software I'm currently under Magic, I.E. Atariworks, Pagestream, Aniplayer,
> etc.?

GEM compliant applications like those mentioned should purr right along in both environments (and then some).

Using any AUTO and ACC utilities?

What screen resolution are you in? If you use something like Videlity to get an enhanced screen size, it will obviously gobble up more memory than the normal 2color by 80column VGA or ST High modes.

How many and how big HD partitions are on your system? Data and FAT caches are typically enabled for each partition recognized at boot. Check that you don't have massive caches set *unless you truly need them*. Check this in CD-ROM devices as well if you have them.

Any chance you have NVDI, Speedo, or something similar that's reserving a big cache of memory for screen fonts?
If you use NVDI or Speedo-GDOS, make sure you don't have any massive GDOS fonts set to cache in memory(see ASSIGN.SYS), also reduce cache size for on screen vector fonts (TrueType-PostScript-Speedo). If possible, you might disable the GDOS part alltogether...the Screen Acceloration is all ya want-need here.

Likewise, if you're using the 'score' module, and your autoloaded SNG file activates alot of fonts...it may be building up lots of font caches.

Take a good look at your MROS folder as well....
Disable any drivers you don't use.

Check Modules and Mixer Maps....be sure something potentially hudge, like perhaps 'studio-module' isn't set memory resident.

Make sure your autoloaded song doesn't 'accidentally' assign some audio to a sample or RAM track. An easy mistake to make.

I haven't paid much attention to this to be honest, as I've never run out of memory. Also consider that CAF does alot of things realtime, and it might go ahead and allocate a pretty big chunk of memory that it's not necissarily 'using' if it's there for the taking. Interesting, now You've brought this up...I'll play closer attention next CAF session.

It's a gfx viewer/converter (like GraphicConverter/Xnview) but the main goal of this application is to be a "bridge" between the futur AGP/USB CT60 extention from Rodolphe and USB Cam.

MiNT needs a AES and a desktop to be useable with GEM app.

There are some free AES but NAES2 is the best.

http://www.woller.com/naes/n_aes1.html

But if you can wait, another AES/desktop is close to be released:

http://olivier.landemarre.free.fr/gem/myaes/

-->It's only in french but if you can see the screenshoot.

1411. Magic vs MiNT vs Gevena vs TOS vs...

Newsgroup: comp.sys.atari.st
Date: 2004-02-13 12:23:04 UTC
From: George Nakos <ggn@atariROCKS.org>
Message-ID: <opr3a50qsimj6qhx@news.ntua.gr>
Source record: 20500

Hi all,

I'm starting this thread for 2 reasons: a) I'm a bit tired of reading the same subject again and again and decided to give it a little twist, b) Personal need.

So, without any further ado, my situation is this:

I have a stock STE with 4 Megs of memory, in which I'll be adding a hard drive (and maybe more) in this week. Being a floppy user (Atari-wise) all these years I never thought of having any other OSes than plain old TOS, but now, since I'll be getting some more space, I thought I might as well throw in a desktop/accs/resident progs setup there as well!

So, which one would you suggest on these (fewer than the other posts) resources?

Also note that my favorite activity for my Atari (so far) is to boot it up, load Turbo Assembler or GFA BASIC and start coding! (maybe the number of activities will mutiply with the hdd, but you get the picture).

I really await your responses!

1. NVDI
Get this if you don't already have it! Watch your screen-speed seem to double or better! You'll also get a nice GDOS that supports GDOS,TT,PS,and Speedo vector fonts.

If you really want a vfat file system that supports long file-names....more drive letters, capacity for larger partitions, DOS type partitions, etc....
Get HD-Driver and MagiC.
MagiC is preemtive, and quite good....but keep in mind it's more suited for GEM applications and won't like screen based games and utilities too much.

If you're looking at a more basic HD system, and are happy with the file system you've got, Geneva really is a nice cooperative multitasking AES. Geneva's Forte is low memory requirements, and it's well suited for more truly legacy apps intended to run on stock ST/e machines. You'll have better luck with non GEM apps here than with MagiC.

MiNT on an ST......
Older kernels will work.
On an ST....MiNT without any AES and your favorite shell *sh, tcsh, bash* can be quite useful, given you like the old unix style text mode. You can also use older MiNT kernels with Geneva, making it into a preemtive multitasking AES.

Given MiNT-net and a few other things running, along with an AES....there's not much RAM left to play around with.

N.AES/MiNT is also a possibility...I haven't tried this yet on a 4meg ST....
Given a lean setup....it should be quite doable and useable.

Again, MiNT+AES is well suited for GEM applications, or things that run under your unix environments....screen based things like games or older apps like MS Word - KCS, etc, are likely to break.

SF0218 wrote:

> That's a sharp looking desktop Janez!! Which of the appline type
> utilities are you using? Appline, XTask, or other?

I use taskbar. It has some nice abilities, and very usable for drag n drop etc, and managing applications. And it can use Thing's groups (similar thing as symbolic links) for its "Start" feature, which can be also used to copy things, if destination is a folder...

> So which do you prefer? Magic or Mint? I've been told that Mint is
> actually more stable that Magic.

I prefer MiNT. Stability is not main reason. Magic isnt that bad, but i had some bad issues with IDE hdd, got MBR wiped 3 times after Magic had crashed. It was however 4.x version, so im sure 6.20 is not that touchy. Main reason for me is unix compatibility, i use ethernet on MiNT for ages, run a MiNT based server and ran router (Atari TT) till last year and have nfs net etc.... But i do have CT2 accelerator, so more as 14mb RAM, which is quite important. Setup u see, with Xgem server (allows to run unix Xwindows apps (like that clock) in GEM windows) uses some 9MB ram just to boot. I also ran 5 virtual consoles, 2 shells and some unix cli apps as default... I see from your sig u have 14mb RAM and 540mb hdd. Full MiNT wont run happy on such setup... not enough ram and some 200mb (full install) hdd space wull be used for MiNT itself. U need to consider either Magic, or MultiTOS like MiNT setup. That means u use MiNt kernel and AES (xaaes or n.aes) and one of desktops ONLY. In this case useability is similar as is for Magic, better things are choosable aes, stability and possibility of using loadable devices and some MiNT drivers for internet etc (this part, using unix drivers etc, need some manual work).. Magoc is installed easier, use less RAM and feels faster.. I wrote feel, because redraw is faster as on MiNT and also mtasking, untill u run more as few processes or some more CPU demanding processes, them MiNT start to behave better, but with !$mb ram ull hardly came to that...

Janez

P.S i have some other snapshots if u are interested..

I wouldnt really agree... i had used both and Thing has its aduts to show. But ned to say as well that i mean last version, which is 1.29beta. Its not real release, but Thing author send it to anyone who ask for it. Thing has some nice stuff like dir jumpinjg, relative folders, application installation features.. etc, Jinee is very MAC lokalike, but i especialy like spring folders feature, id love to see that in Thing....

As counterweight to Geneva/MiNT: old kernels (1.14.x) can boot, load devices like ext2 etc drivers and return to TOS. Little RAM usage... What to do with ext2 filesystem etc in TOS is another matter.. and its still single tasking....

However for coding, i recomend u good old TOS. Small and STABLE. And if u crash, u bootup back emediately. :)

> N.AES/MiNT is also a possibility...I haven't tried this yet on a 4meg
> ST.... Given a lean setup....it should be quite doable and useable.

I have 1.14.9 kernel, naes 1.2 and Thing on MST4, boots up with 1.9mb free ram... Still i use Magic V3 on ST. Small fast, bloatfree OS. So either TOS or Magic v.3xx, or maybe Geneva, without MiNT, since cooperative is not THAT bad, that MiNT would justify more Ram usage...

Janez

Thanks to everyone!!!!!!!!!!!!! You all have helped me to make my choice, and that is to stick with Magic. I will be uprading to Magic v6.2 this month month. It's a package deal which includes Jinee2.5, Scripter, and Aniplayer. I will also by buying a second hand cdrw drive. That's after I find out if cdwriter suite will recognize the drive. Unless there's another cd utility out there that will do so.

Anyhow, thanks everybody, and this definitely won't be the last time I'm here!! :)

Actually I have and use all of them. There are just some programs
that will work better under Geneva and TOS than they do under
Magic and Mint. I was starting from scratch I would choose Geneva
for older programs and Mint for everything else since it still
being supported.

My wife has a HP 2100 Laser printer and it works fine with NVDI. I
just used one of the HP laser printer drivers on NVDI's list.

For ease of use, STik/GluStik is better. Overall STing is the one
if you can set it up correctly.

It has nothing to do with ADSL or whatever.
As you might know the ftp-server is located on a school in Brussels. I'm not affiliated to that school. In fact they even don't know me at all. Thanks to an ex-student (Saka) who happens to be an Atari-lover I may use that ftp-server.
Every year or so there is a new student/webmaster in charge of the servers. Until recently Saka knew every webmaster/student personaly but at this moment there is a new student in charge which is unknow to Saka. That guy has blocked the anonymous ftp access. The ftp-server is still running but unreachable for anonymous ftp. Last week Saka managed to get in contact with the new webmaster. He promished Saka to restore the anonymous access but so far ...

I hope he will do that soon.

TTFN,
Martin

Just tested under Magic and the 68020 version runs fine on my TT. Did not
try all formats, though :-)

Your url was however outdated. To get it surf to
http://perso.wanadoo.fr/pierre.g/ and navigate from there. The actual
download is via ftp now.

I'm not sure if the company exists. Many of these firms were bought up so copyrights may be taken up by the new firm. On the other hand if a company shuts then copyright can revert back to the original authors. In theory the copyrights will still be in force.

I have a Falcon with a CT60. All was well except for some disk corruption problems when using the CT60, so I decided to remove my clock patch and do the installation with solders. I must have damaged something, as with or without the CT60 I get horizontal scrolling lines when I boot most of the time. When I can get it to boot to the desktop, Aniplayer will not play video as it did before. It says "out of CVID memory." I've tested a few other things and they did work as normal. I reverted the installation back to where it was before (removed the ribbon cable and re-connected everything) but I still get the same result. I've checked and re-checked the motherboard several times, and I can't see any physical problems. Does anyone have an idea what may be wrong? Rodolphe Czuba has been very helpful, but I think I've exhausted all my options unless I send the motherboard to him. I'm looking for a replacement, but I'd like to have my original board repaired. Please help!

As an intermediate step, you could send the motherboard to me. I'm assuming you live in the US, as I vaguely thought you did. What good would this be? Well I can swap chips here and there and see if I can find a bad one. Problem is videl and stuff aren't socketed so can't fix them. But with a good falcon right beside me and what is amounting to be a lot of hardship in getting my ct60/falcon running as well as the skill to get it running at 25MHz and install the solders with no problem (well remaining ST-ram access problem on my falcon that isn't my fault), I might be able to help you with something. To be perfectly honest, it sounds as if you fried a clock that deals with video and system. Some parts of the system can run at this distorted or broken clock rate, other parts cannot (crashes), and some obvious signs are present like broken video sync rates.

I have many of the clocks socketed or otherwise to try. Also upon removal you could have damaged the solder joint of the main ct60 clock pad. I'm reasonably confident your falcon isn't screwed beyond simple repair, but instead is in need of some rodolphe style assistance. I can do the next best thing - swapping things here and there to see if I can get it running properly, plus I can install your 20/25Mhz clock and you'll be good to go.

Rodolphe charges 60EUR for the job. I'll charge $10USD + shipping. Keep in mind, my job is not done with the absolute precision that rodolphe's is (I do have an excellent ESD safe soldering station though), and I am not quite as "tuned to the falcon" as he is. Many people report strange enhancements on their boards after they return from Rodolphe, to settle

final strange quirks that many falcons can have here or there. TBH it's better to send it to him, I'm just offering my help if you want it. Also my falcon's overclock turned out perfect but I cannot offer any kind of warranty. If I b0rk your falcon further, it can't be my problem. I don't have any spare falcons nor spare cash :) But I can assure you, I will be 500% more careful with your falcon than I was with mine.

With all that crap said, it's up to you what you want to do. First thing I would check is clocks!, but ask Rodolphe, he's the professional.

Thanks,
Mark

Sam,

My poor guide:
http://portal.atari-source.com/modules.php?op=modload&name=Sections&file=index&req=viewart
icle&artid=8&page=1

A much better guide:
http://www.myatari.net/issues/dec2001/casemod.htm

Bearing in mind of course that since I have written this article, my
falcon has had a home-made MST/e/TT keyboard adapter hooked up to it, and
into that has had a QWERTYX adapter with PS2 keyboard and mouse, the
internal wiring is much more professional as the CT60 allows for it, and I
have since removed the motherboard and spent hours cutting down the case
to look much more perfect. Hardest part of the job for sure was getting
screw mounts right and working around thick portions of hte case. The
falcon's motherboard is just too huge to get along with even the largest
of cases.

What seems to be a strict requirement is a Dremel rotary tool with a slew
of accessories.

Thanks,
Mark

I know nconvert on Atari. But this is a ttp - program.

What I mean was this 'zview' what you can see on this screenshot here:
<http://zorro.arcadia-crew.com/gfx/Capture1.png>

and not 'nconvert'

The only alternative I know about is Soundpool's. Since it doesn't support long file names the choice is obvious!

> So I can't do anything unless I have NAes with Mint & Jinee?
> I'm a little fuzzy here.

You can do much with MiNT all by itself.

To run GEM applications....you need a GEM AES. The AES is the part of your Falcon's OS that provides prefab icons, windows, dialogs, buttons, gadgets, etc to interact with the program. Actually, the TOS ROMS in your Falcon have an AES/GUI, but this is a single tasking AES only. MiNT needs a smarter AES if you wish to run more than one GEM application at once...so the OS can tell what gadgets and windows and such belong to what processes, help manage their memory, and assign processor time, screen redraws and so forth.

There are two FREE multi-tasking GEM-AES subsets that can be used with GEM.
1. AES 4.1 (Also known as MultiTOS, and sometimes seen in versions predating the 4.1, as shipped with lots of Falcons).

2. XXAES is an open source GEM/AES to go with MiNT.

AES 4.1 has a desk-top built in that looks and acts very much like what is built into your Falcon. This desktop can also be replaced with another of your choice (I.E. Jinee).

XXAES does not have a desk-top at all. When no desk-top is used, you get a file selector and may lauch applications from this. You could launch a shell in a TOS Window, or use a virtual console, or load utilities for file management and such. OR, you could install an external desk-top.

Tera Desk, a Desk Top, is very basic in feature and design, but it does work, and it is free, and also open-source.

Jinee and Thing both cost a little money, but both can be used with our without MiNT! Either can be used with MagiC, or Geneva, or even launched by plain TOS to replace the built-in single-tasking desk-top. Both have demo versions about on the net. Why not just grab the demos and TRY them?

N.AES is a well debugged and optomized for speed commercial product that does the same basic thing as AES 4.1 and XXAES (just a little faster, and a lot more polished looking[opinion]). It comes with a special version of Thing...but you are not forced to use Thing...you could use Jinee, Tera Desk, NeoDesk, or no desktop at all!

Also keep in mind....
A fancy desk top isn't necissary under MagiC either. It comes with MagiX, which is pretty dern good in itself. I've been quite happy with MagiX and the

addition of a start bar, and some other click-me utilities for years now myself.

Do not confuse your desk-top replacement with everything else! Look at this as an individual purchase for the desktop that you'd prefer period. If you like Thing or Jinee either one...you can use these two with MiNT, or MagiC, or Plain TOS! You can run them on your PC/MAC Atari Emulators...you can use them pretty much anywhere you want!

You don't have to buy anything to piddle with MiNT on your Falcon. Do you want/need the Unix side of life? This is just my opinion, based on your questions thus far, I say go ahead buy MagiC and Jinee. Install it and start using using it today for your daily work and fun. I doubt you'll ever regret such a purchase...even if you make a TOTAL switch to MiNT on down the road (doubtful with a Stock Falcon).

In your sparetime, download the SpareMiNT package....see if this is even viable and worthwhile to you on a Stock 14meg Falcon. If you find it useful and interesting...say in a few months from now....THEN consider buying N.AES, which you will just plop right on top of your currently working MiNT setup, and have instant choices of AES depending on what you type as you log-in.

Just my two cents, based on personal experience.

> and not 'nconvert'

This app is not Xnview, for information Xnview isn't available for Atari,
only Nconvert is... And this one is only a text based TTP.

The app on the screenshoot isn't available now, I have some little bug in
the plugins system but I hope that I can release it before the end of march.

So, wait some weeks :)

Indeed, its a hardware accelerator. However without its boot software, and
cpx its junk.

Thanks guys,

I was just curious to know if the cooling fan I am using
is really needed or whether I could just use the bigger
heatsink on it's own.

I might be easier just to stick a digital thermometer
against the cpu.

Hi all
Does anyone have any Atari posters they want to sell?
I have received a phone call from someone named Jen, who is hunting up Atari memorabilia for a film shoot. Apparently the scene is a geek playing on his Atari in the 80's, and they want Atari posters (or posters with the Atari logo) for the walls in the background.
She didn't say if they were 8bit or ST.

1465. Re: Atari MIDI Computer (cont.)

Newsgroup: comp.sys.atari.st
Date: 2004-02-15 03:06:43 UTC
From: Luposian <luposian@lycos.com>
Message-ID: <fnBXb.16932$IF1.8976@fed1read01>
Source record: 20454

Imagine, if you will, the Atari STacy. Now, replace the QWERTY keyboard with piano-type keys (much like one of those short MIDI controllers), with a few controller type knobs and switches above them. When the computer boots up (fast, as the entire OS is in ROM), a small trackball allows you to navigate around the OS (MIDI Graphical Interface (MGI)) and select MIDI voices to play and other internal functions.

If the built-in keyboard is too constricting, use the MIDI In/Out ports or the USB to use an external MIDI keyboard and use the "MIDI STacy" as a simple sequencer. When you're done, save your GM file to a built-in 1.44 floppy drive. Use the "MIDI STacy" to play back your work, too.

This computer would be MIDI only. You can't go online, or play games, or do word processing with it. But what you can do, you can do extremely well and efficiently.

I see it as really the only niche "Atari" could get back into with any real hope of success, to build a name for itself in hardware again.

Any ideas/input/suggestions?

Luposian

The market is flooded with these kinds of gadgets.
Really, to make a new 'ground breaking' product that will urge musicians to shell out for something they can't nickle and dime together with 10 year old stuff from ebay (A Workstation Keyboard is essentially what you've described here), someone's gonna have to really push the envelope!

All the so called compitition in pro audio is backing out...making less, and downsizing in major ways. To change this trend of 'no-one's buying new stuff anymore'...they need to really do something that makes the crap the markets are flooded with obsolete!

1. SMALL LIGHT equipment that doesn't fall apart.
2. SMALL LIGHT equipment that doesn't fall apart.
3. SMALL LIGHT equipment that doesn't fall apart.

I know I sound like a broken record here...but here are things musician's have to replace pretty often anyway. They are hudge, bulky, EXPENSIVE, and there's all sorts of room for new patents and developments.

1. Digital Audio Snakes! Wireless, Coax, or Fiber based. 32 channels on a conventional analogue snake requires a massive cable...really heavy...expensive, and calls for constant repairs! Why not use a simple coax with a multiplexer at the ends? There's enough bandwidth on even cheap'o coax...going all analogue...to cram hundreds of channels on one line! Don't believe me? How is it your little 8lbd plasma TV set can keep up with 100+ cable channels (each with 2 to 4 audio channels in addition to the NTSC or PAL video)?!?

2. Notebook thin and super light mixing-consoles and lighting-dimmer-boards. It'd be nice to have a powerful mixer that's programmable, and doesn't require 4 men to move around, and a road-case big enough to bury both your parents in!

3. Cool running amplifiers that don't cause neighborhood brown-outs cause they're so power hungry! It's sad when you've got all these amps with 3 lbs of cheap electronics, and 50lbs of EXPENSIVE chassis and solid steel heat sinks! Then add the next 40lbs of expensive racks and coasters! There HAS to be a better way!

4. Speakers that are lighter and smaller! Speakers built of smaller arrays where a sound engineer, assisted by software, can fine tune crossfades, overtones, direction, and much much more. The days of relying on sheer power to loft out a pretty shitty mix should be long gone by now! Being shaken to death on the floor level, and not hearing a thing in the 'expensive seats' is a problem that with some thought....and good software...and the right kind of speaker array mounted on pivot points etc...well, it's a problem that could GO AWAY in a relatively affordable way.

5. A PA system for dummies! I'm so sick of going to events that have good musicians performing good music...but you can't tell a damn thing about it cause the idiot at the mixing console doesn't understand that a constant 440 reverb just ruins the whole performance, or that a really badly tuned piano run through 3 chorus modules is getting pretty close to fingernails on a chalk board! With computers and software what it is today...you'd think some company would put out a system that's smart enough to reduce or eliminate most of these bone-headed errors!

Seriously....
I belive that if engineers put their minds to it...
What currently takes a 5 ton box truck to haul around could be reduced to something that fits in a well designed hatch back (32mpg or better!).

If you want a retro MIDI workstation...hit eBay...there's tons of that stuff no-one wants anymore...for less than $500 you can find a K2000, DPM3/4/SI, etc...and sequence your heart out ;)

If you wanna dream up a new machine...please do...but give us something the industry is crying for....not something we're trying to pawn off on eBay in order to pay for our Box Trucks and fuel bills.

From: "Kenneth Medin" <kennethm@tripnet.se>
Date: Wed, 11 Feb 2004 00:06:32 GMT

Hi Kenneth,

>Afaik the Yamaha drives are actually IDE units with internal SCSI
>adaptors. Who knows, it might be possible to attach an IDE HD as well :-)

I forgot alll about that.... but in order to do this you'll have to break
the case open, as far as I could tell Yamaha made a very tight enclosure,
no screws no nothing... it's melted together. The case only has one SCSI-
port, it's ment to be used as the last one in the chain.
The default setting is ID6 and can not be changed.

>>http://www.macway.com (they accept credit cards and ship worldwide).
>
>Strange, they are supposed to be sold out everywhere... Maybe the French
>language keep foreign buyers out...

There are lots of these still for sale, but most dealers ask prices for it
that are out of this world... I don't think it's the language that keeps
foreign buyers out but more likely the SCSI interface. Why spend extra
money on a SCSI burner when you can get one cheaper with a Firewire or USB
interface? A SCSI interface is a necessity for us, but on other platforms
it's just one more outdated and expensive protocol. Firewire and USB2 are
the new kids in town.

Cheers from Belgium
Dennis

Hi Kenneth,

>What concerns me is how HDDriver could access both at the same time. Like
>Mr Flessa stated by issuing ID x _and_ ID x+1 or how?

No..
It has one device number, but uses two LUN's. HD Driver sees this setup as
two different drives and treats them like that also.

>he HP Laserjet 1300 is listed as being DOS compatible and able to
>emulate PCL5e, so I'd suspect the 1300 could be used with NVDI. I
>haven't verified this, however.

The problem with todays printers is that the manufacturers in order to save a couple of cents got rid of all dip switches and configurable buttons. So although a printer might be DOS compatible and have a PCL emulation mode, the problem for Atari users is how to configure it in that mode. Something relatively simple like changing the page length or characters per inch is impossible on most printers now without the appropriate PC or Mac software.
IMO the best way is to configure the printer to your hearts delight on a PC or Mac and then connect it to the Atari. People who don't have access to other computers should take a look at the OKI laser printers, these are about the only ones that are still fully configurable by hand.

Cheers from Belgium

>way. And as of last night, I've come to the determination that both cdr's
>are defective.

Do you mean you've opened up the enclosures, took the drives out, and set the termination switch? Also did you try the MetaDOS archive that I mailed you over last week? It seems very unlikely to me that your two drives are defective :-/

>There, no more crashes. Now, may I please have your suggestions. :)

Since you have the enclosure and cables, all you need is a bare CD-R or CD-writer, if you opt for a CD-Writer make sure it's an MMC-3 compatible drive, these will work with the SoundPool and Anodyne CD-burning software. Stay away from unknown brands but go for something like Yamaha, Plextor, Teac, Ricoh etc...

Cheers from Belgium

> on-topic).
>
> b. spammed or sent to often.
>
> c. against the majority of the "group member's" wishes.

IMHO the posts are compliant with point "b", and I wouldn't be one bit
surprised if they are compliant with point "c" also.

>Quite a few of your posts are imho actually most on-topic in
>comp.sys.atari.advocacy and should therefore be posted or FUT'ed there.

That's your opinon... you overlook that I *reply* to posts, I can't really
remember the last time I started a thread here... and it is on-topic, he's
not posting his crap to the advocacy group but right here!

>>Yes, and that's what I was trying to say. Undoubtedly there will be
>>people who will be over the moon with the stuff on sale, but the average
>>user in this group has very little to choose from...
>
>But the average 16-bit retrogamer in this group will!

A 16-bit retrogamer is *not* the average user here. I would say he's more
the exception...

>It's up to Ben alone if he likes to sell old or new stuff. It's up to his
>customers do decide if the want to buy from him.

Of course it is, that's why they call it free enterprise. But I'm not the
one saying that business is though and that I didn't make one single sale
last month... also, his weekly spam is not ment to remind his "customers"
that he's still alive.

>>That is not true! I read through his 16 bit catalogue the other night and
>>there are _lots_ of stuff. Took a couple of hours or so as the list is
>>not categorised.
>>
>>Fine Kenneth, so then I'm lying!
>
>Unfortunately you are. Proven by the fact that: If someone wants do buy a

>16-bit 520ST and some 16-bit ST games Ben has it all in stock.

Make up your mind please.... one minute you're talking about power users and the next minute you start driveling away about buying a 520ST, who in his right mind would even pay for this? They can be picked up for free all over the world...

>>Well, Anyone based in the US wanting i.e Calamus 2003, Link 97, Ethernet
>>interface, processor upgrades, ram upgrades, graphic cards, the ASH
>>software catalogue and a whole lot more of recent stuff, stop bothering
>>us from now on, and order it directly from Ben, it may not be obvious,
>>but it's all hidden somewhere in his catalogue.
>
>Yet another false statement!

Ever heard of irony? Of course it's a false statement because Bravo Sierra unfortunately hasn't got one single item of the above, and I very much doubt that he's even capable of getting his hands on it either. A dealer who comes in here asking where he can obtain ICD links... not to mention he bothered us nearly a whole year long asking where he cold obtain a MegaST. And you expect me to take that business serious?

He is not an Atari dealer, well not in the real sense of the word, he happens to have a very large stock of old outdated hardware & software which might be of interest to *some*, but that's it. The majority of posters and people following CSAST, *need* other stuff, stuff which he can't supply.

Cheers from Belgium

Agreed. Thing doesn't have multithreaded copy/delete which is irritating.
Most times I find myself doing copy/delete ops from the command line
anymore because I can do rm -rf /somedir & and while it deletes continue
to do other work. I must say at this point Jinnee is a better deal.

Probably yes ;-)

The 060 is have seen so far in Milans worked fine with very minimal cooling
- ie. a small CPU heatsink without fan. If the heatsink is attached with
some kind of thermal-conductive material (thermal grease or glue), if it
feels warm but not hot, then the CPU is OK. Even in a case with low
ventilation, a bigger heatsink should do the job without a CPU fan.

There is a german program named "Porthos". Look at
<http://www.dsd.net/prod/atari/porthos.php>. This page and the manual
are in german, but the program itself has english resources as well.
The program costs 35 EUR. The free demo-version shows only one page of
a PDF-file.

Mark,
I got mine from Anodyne. At the time, they had several used ones laying around and were willing to sell them. Email and ask.

Also, go to the Mac newsgroups and post what you're looking for. You're likely to get several replies offering to sell you one. You might also try some of the online Mac Specalist shops.

Hallo Carey!

CC>Anyone know of a PDF program that can read and print pdf files on the
CC>Atari???

There are at least three of them:

- For MiNT, there's the latest ghostscript available in RPM format from the SpareMiNT site, together with gv. Freeware.

- For all systems, there's the commercial Porthos PDF viewer from Peter Domrï¿½se. It has got some additional support for Calamus, and is available from http://www.dsd.net/prod/atari/porthos.php

- The third program is MyPDF, but that one is still alpha and not publicly available. http://mypdf.atari-users.net/

Hallo Michael!

MS>The 060 is have seen so far in Milans worked fine with very minimal
MS>cooling - ie. a small CPU heatsink without fan.

Would this apply for my 040@25Mhz also? There's a small heatsink with fan glued
to it, with a drop of thermal glue in the main part of the chip area and four
drops of glue at the four edges, but I already had to replace the fan and it's
nevertheless noisy :-(

First of all, thanks to all for the suggestions!

Now, on to some other comments/questions:

The main thing for me at this moment is for my 2-3 favortie apps to load up & run flawlessly. To be more precise: these apps are: Turbo Assembler, Bugaboo & GFA-BASIC. It would be a bit of a bummer if I installed, for example, MagiC (after buying it of course) only to find out that Bugaboo (which is a very powerful debugger) crashes with it. Same goes with Geneva ot MiNT.

On Fri, 13 Feb 2004 16:06:50 -0500, a lot of people wrote

Well, provided that your computer can handle it, Bugaboo is a very crash-proof debugger. Pros are that it is even reset proof (!), clobbers any interrupt while its interface is running etc. But you have to use it only in ST med or hi res. So, it's not a OS stability problem, it's an OS/software compatibiliry problem :)

>
>> I have 1.14.9 kernel, naes 1.2 and Thing on MST4, boots up with 1.9mb

>> ram... Still i use Magic V3 on ST. Small fast, bloatfree OS. So either
>> TOS
>> or Magic v.3xx, or maybe Geneva, without MiNT, since cooperative is not
>> THAT bad, that MiNT would justify more Ram usage...

Is Magic v3 avaliable freely or comercially? Or will I have to buy 6.xx?

Won't MagiC use LFN with another HD driver? One of my (future) projects will (probably!) be disassembling and fully commenting CBHD driver (and perhaps extending it)!

It is true to say that most dongles adherred to the 'black is v2, red is v3
and Score' pattern.

Except that the last V3 and Score dongles were supplied to me by Steinberg
in a black case with a Score sticker on the side.

FamilyNet Newsgate

I've set up a website devoted to all the good ole computing fun that can be done in the Dallas/ Fort Worth area. We have an updated version of Rev Jim's BBS list, a links to various user groups, and a online chat room /message area.

I hope to work on the Austin, Texas version of this soon, so wiether you live in Dallas/Fort Worth or Austin, please check out my website at...

http://jybolac.atari.org

Then write me at drclu@swbell.net

Let me know...

1) If there are any BBS's that should be added to that list.
2) If there are any user group links in your area that should be added.

I would like to know of telnet only BBS's in the Dallas/Fort Worth and Austin areas as well.

If you are not in Dallas/Forth Worth or Austin, simply write me, and let me know you would like a webpage like this made, and if I get more votes from your city, I'll make your next. :)

Thanks and come check it out. We have live chats 8 pm CST Thursday night and 10 am Sunday morning (CST)

Rodolphe,

If the users are available would you have interest in doing this? I think it's a very valid idea as I have 2 TT's myself and I think they're fairly common, perhaps more than the falcon, may be able to muster up more interested people. TT's make a great server and I envision Atari-source.com running on a CT60 TT some day ;)

The only reason I ask this is because I know that your work on a coldfire project or AGP/USB/PCI board is much much more important than another accelerator board. A new platform machine would be very good (coldfire) and I would be on the buyer's list. I feel ashamed I couldn't get my act together financially for hades or Milan.

But if you have interest in adapting CT60 to work with the TT, I'm sure we could rouse up the effort to get confirmed buyers without you having to worry about those details. I could setup a site to handle it in stages. The first step would be "basic interest" and detail how many people are basically considering it or at least interested. If say 200 people go, you do small planning and release some details about how it would be designed and what can be expected. Then we do confirm list. If 150 preorders come in paid in full then you can work otherwise refund the money. Do 1 year time span for preorders to come in.

Thing is, based on things I heard I feel that there may be interest in TT accelerator, though I don't know how much. I don't know why Didier or someone else qualified wouldn't be interested in writing the software for it either. Maybe he could be paid? I'd sponsor an effort all I could.

If I ever win the lottery or come across some money you can count on the fastest atari clone imagineable to come to market. Of course it would be a massive money loser but you don't worry about things like that when you win the lottery ;-) I figure 3-5 million USD would get the job done.

Hi Sam-

I'm using Stik 2 here in Seattle on foxinternet. If you want, I can send script files to help get you set up. I've heard that both programs are pretty good, and it depends on what internet clients you want to use WITH them. I have Newsie and Cab, altho I don't use Cab much, as it's not very good for browsing. Doesn't do Java script, or cascading sheet pages, or secure pages, plus it's just plain slow. That was the main reason I now also have a whine doze machine.

There you have it!

1509. Formatting 44 Meg Syquest Drive Cartridges

Newsgroup: comp.sys.atari.st
Date: 2004-02-17 08:58:38 UTC
From: A Walshe <acs@webaxs.net>
Message-ID: <c0sl3j$219p$1@arachne.labyrinth.net.au>
Source record: 20398

Hi all
I recently was given a SCSI 88 Meg SyQuest drive which and some 44 meg cartridges (I'm assuming they are compatible). My problem is that I cannot format the carts. HDDriver Ver. 6 recognises the drive and is able to do a sector test successfully, and TOS recognises 4 partitions (using install devices) and attempts to access the drive (the drive led flashes) when double clicking on the drive icons. I have tried what I assume is the copy protection red disk in both positions and that doesn't help. I am running and Atari TT.

Any ideas to help solve the problem would be appreciated.

Thanks

Formatting shouldn't be necessary.. but have you tried to just
repartition it?

Maurits.

Yes I did try to repartition it but with no success. May be I wasn't doing
something correctly? I'll try again!

Thanks

The CTT60 project is possible only if somebody can replace Ddier Mequignon
to do on TOS 3.06 all the work he did on TOS 4.04 !
Find this guy and it is possible !
No guy and the subject is closed !

Didier has a Falcon and not a TT and I'm sure he will never want to bore
time patching and trying understand inside the TOS 3.06.

I don't think a configuration error can cause that, especially if you
can see the drive fine.. and you get "couldn't write boot sector" with
the write protect switch both ways? Hmm.. I can't think of any other
cause than a broken medium or drive..

Let me know if you find more simptoms, perhaps that can give a hint :)

Maurits.

I had similiar problems with a Conner 40 MB HD in my Stacy. HDDriver8
could not partition or format it. Reverted to AHDI and it partitioned
just fine. Then installed HDDriver on it and now it runs just fine. Uwe

Seimet claimed HDDriver should be able to do the partition but it simply
did not work here.

I fully agree, and of course there's interest in a TT accelerator, ask any
TT user if he wouldn't like to have some more horse power available...
I really would like to meet the person who would say "no thanks, my TT030
is fast enough"....
Hell, it doesn't even have to be an accelerator with a hard to find 68060,
I would even settle for a 68040.

>If I ever win the lottery or come across some money you can count on the

If it's what I think it is, it's near the SIMM sockets. It was on
some STE's, others (later ones?) had it on the motherboard as it
should be.

Can't remember what it was for, look on the schematics, I think there
is a note on them about this chip.

It is in front of the simm sockets. one chip is dated 1988 so its a older
machine. I have another STE which is 1991 which has 3 chips on board and not
2, so it looks like your right about that. I can't see too well what its
for, might be something to do with some reset or init "re-think"

Message-ID: <1077038002-963943AEicMi@adelphia.net>
Source record: 20410

Anyone,
Does anyone know where I can get a SCSI PCMCIA card
reader for reading COMPACT FLASH media??? I have done
some searches and the cheapest I have found is around
300 dollars. I am sure there has to be someone that
sells these much cheaper than that. Especially since
I read an article in MyAtari where the guy who wrote
the article was saying that they should be between 100
and 150 dollars. Any help on this matter would be
greatly appreciated.

thanks,

1523. SEDT for Atari wanted.

Newsgroup: comp.sys.atari.st
Date: 2004-02-18 01:20:47 UTC
From: yf110@vtn1.victoria.tc.ca
Message-ID: <4032bdef@news.victoria.tc.ca>
Source record: 20411

Every once in a while I ask, just in case.

I would like to get a copy of the sedt editor for atari ST. The atari files are not available on Anker Berg-Sonne's web page (because he doesn't have any atari files anymore, I asked him several years ago). Google has many old links to files and sites that are no longer available.

Someone out there may have a compiled sedt editor (TOS or GEMS version) and could send me a copy. (sedt used to be shareware, but has been freeware for some time, so there is no issue in doing this).

Thanks to anyone who might help.

Malcolm

On the 44's it is a rotating "thumbscrew". On my carts they are red. If red shows at the label edge of the cart, it is protected.

What model of the Syquest 88MB drive do you have?

The original Syquest 88MB drive could only *read* 44MB cartridges.

The later Syquest 88MB C (Note the "C"!) could read, write and format 44MB cartridges.

The label on the front should say "88 MB" or "88 MB C". So you should be able to tell which drive you have.

Hope that helps!

Well that explains it! is a 88 Meg model without the "C". I'll have to find
some 88 Meg Carts for it.

Thanks every body for your help, it is most appreciated!

Go and adapt the EmuTOS! I'm sure there are people that would like to do
that! TT HW is not that magic in comparison to F030, so it should be
quite straightforward to add the needed HW interfaces into EmuTOS.

> Didier has a Falcon and not a TT and I'm sure he will never want to bore

Hello all,

How is everybody doing?

Question: Which case is best for re-casing the Falcon, as concerns cost, time, end user fitting, availability, and anything else you can think of.

A: The Wizztronics rack case (still available, bot w/o psu)

B: The Desk Topper case (I think Keychange UK offers it, but it doesn't look the same)

C: The Eiffel(spelling)? Rocket case (seen pics of it, don't think it's available)

D: Full tower pc case

Thanks!!

It isn't the same!

My rack case is designed to take the ST or the Falcon, it has nowt to do
with the desktopper.

The bare case is £25 UKP, the basic kit of parts inc a new Floppy Disc is
£30. DIY only.

Hello if you just look the price the PC tower is the best but you need to make
the connectic its can for litle price tower whit power for 60 euros and some
connectic for 10 euros the dificulty is for the screen and the IDE interface
you need long cable the scsi if you ave out centronic 50 is not hard
but for the floppy its rarity to find y do for me two falcon ist simply
you need to care to the volt of mother board and pick the pin off the old falcon

Or even better at:

http://ftp.leo.org/pub/comp/usenet/comp.binaries.atari.st/stedt/

Where both a gem and ttp seems to be waiting for you to pick them up...

I'm actually a bit proud that I found the files. Had no idea they existed
until tonight :-)

Might be worth going through these old archives. Perhaps other
interesting stuff is hiding there?

Posted to comp.binaries.atari.st on Sept. 25 1989

It will take some effort to unpack:

1. Unpack each part with gzip
2. Unpack the uue multiparts
3. Unpack the two .ARC archives

It looks OK but i have not actually tried myself... Might also be a too
old version... No idea, really...

> I have a stock STE with 4 Megs of memory, in which I'll be adding a
> hard drive (and maybe more) in this week. Being a floppy user (Atari-wise)

I ran a 4 Mb STE and a 52Mb hard drive for years with Geneva/NeoDesk4
and loved it. You really don't have enough memory for a full MiNT
installation, so Magic and Geneva are your only practical choices.
TOS is pretty limited by comparison.

In both Magic and Geneva you will get multitasking and the ability to
use an alternative, vastly improved desktop (such as Teradesk, Jinnee,
or NeoDesk).

Magic's greatest strength in my opinion, is the abiltity to use of
long file names. The disadvantage is that compatibility is a bit
questionable, particularly with games and non-GEM programs.

Geneva's strength is compatibility. Very little will not run under
it, and you can alternate between TOS and Geneva by simply running or
not running a single AUTO folder program. Nothing else need be
changed.

You should really consider a handful of additonal programs. NVDI
speeds up the screen redraws considerably. It also provides printer
support for most pre-2000 printers. A CD driver (like Extendos)
allows your Atari to read CDs and to function as a CD player.
HDDriver allows for a far greater compatibility than the ancient AHDI
utilities. Finally, a startup program (like XBoot) allows you to make
changes to your setup for different purposes. Adding these and a
desktop to either Geneva or Magic will take up a little under 2 Mb of
RAM.

Once you get used to having a hard drive, luxuries tend to become more
necessary. My STe also ran a calendar program called CAL and a
desktop clock.

Damn! I would love to tinker with such a project, codewise. I'd even do it
for free. The only problem is, I don't have a TT :(

> What do you do? If I can ask you... Just wondering... ;)

I'm looking for a job as electronic hardware designer or electronic technician...in france or switzerland.
The CT60 is just a nice thing but I cannot live with that...

The rest of the time is to check now for a second CT60 production and when I get more time I think about the PCI+USB card...I have not yet drawn the schematics...but it will be nextly I hope...

And the rest if to live with my familly and try that without stress of being jobless ;-)

Maybe the better solution is to use the CT60 TOS4 and adapt it on TT
hardware... using the Tos 3.06 addresses settings.

I have an incomplete one on the shelf, don't know what's missing but I can check against the complete Mk X I have for sale.

Further, for those who have enquired about my rack case for the ST and Falcon I can now tell you the weight of the kit, inc the keyboard and packing is 8kgs.

Anyone want pics, email me.

Overseas customers may find it easier to get a quote from a local shipper to collect in the UK.

Frankly, I'd just go to http://hardware.atari.org and order a complete
built EtherNEC device for $75 shipped. It's easy to set up on
whatever your OS of choice is, and works flawlessly.

You have to think in terms of what your time is worth. This is the
quickest and most stable solution.

What's holding the webmaster to restore anonymous access I don't know.
It's just a matter of a few seconds to do so, at least if the current
webmaster knows what he's doing.

Not that many, maybe 350 MB. This weekend I'll download the whole
server. I believe there is a French mirror of the Chapelie but right now
I can't remember me the URL.

>correct when you hit answer in your email program.

Thank you for your help.

I now have another question. I want so solder a H10 connector to the Eclipse card. Rodolphe told me that it is necessary to cut the trace between pin 20 and 22 on any falcon expansion board when I want to use it with the ct60. I did this already with my NOVA card and my screeneye digitizer but I believe that on the Eclipse pin20 and 22 are not connected in any way. Is this correct?

Regards,

Frank

This may be the case, but then you have question of VME, etc. Don't know how that's all going to work. But at least the rest of the hardware is similar/identical.

Regardless if the CTT60 project starts and there are enough interested preorders and rodolphe agrees to do the project, the person with enough credentials to hack up whatever TOS it will run can *borrow* one of my TT's for the amount of time needed to complete the project with some time after that. I say borrow because neither of them are getting sold or given away at this point ;-).

I wonder how fast-ram would work. I guess you would simply remove all tt-ram installed in favor of better SD-ram. Would a TT CT60 be faster since the TT seems faster for certain things like disk access or general bus speed?

Thanks,
Mark

>nevertheless noisy :-(

Probably - I usually run both 040 and 060 without fan.

With a decent heatsink attachment (with low thermal resistance), and the
relatively low power a 040/060 uses[1], there is no huge temperature
difference between CPU case and heatsink, so if you can touch the heatsink
for a longer time, it is probably OK.

[1] At least in a Milan, with the 060 in half-speed mode - I have no
experience with fullspeed bus.

Sam,

You've been going a little nuts with your posts. This is a helpful group and all but it seems like you're really not doing any side research at all. Most of the Atari websites around go into great detail about cases, accelerators, etc. I also sent you details of my falcon tower case. In general, the defacto accelerator is the CT60 but you may be too late to get your hands on it. As for the others? They're just bus overclocks, not that fast. Someone might sell you their CT2 falcon and it's possible rodolphe might run another batch of CT60's. Carefully stay tuned to this list as you will surely notice. As far as obtaining your accelerator. You'd probably be best served to purchase anything that crosses your path... there may not be that much to cross your path - but the CT60 is by far the cream of the crop!

As for cases. the defacto case is a home brewed chopped apart PC tower. I rarely see other cases for sale except for instance Keychange Music, but from the UK I can't imagine the shipping on a fairly big 8KG box would be too cheap. Probably $20-$40. You can get a NICE antec case for $60-80, but you have to do the adaptation work yourself. It's really not too tough. be inventive ;-)

If the threads you start aren't really getting hit, it's because people just don't have that much to say. Check out the magic vs. mint threads on the other hand. If people have something to say, they will say it :) No need to start 800 threads ;-), reply to your own original thread about falcon cases and it'll help at least my news reader be more manageable. Maybe others don't care, and certainly people will still respond.

And this is not a demand. Simply a request laced with advice :)

Thanks,
Mark

As for my falcon case, it's some crappy pc tower (and I mean CRAPPY) that
I bought from a computer show where I could see the case and do
measurements and make sure the falcon board would at least come close to
fitting inside.

My Mega STe is housed inside an old Sun Photoprocessing machine case. A
very large tower case on castor wheels.

Thanks,
Mark

Being something of a purist, I prefer to keep my antique machines in their original cases.

However, when I got hold of a rather beat-up 1040 STE (It was originally a display model, I think, because someone had glued in the floppy drive button so you couldn't eject the disk, and it had presumably taken a lot of abuse at the hands of customers), I took both it and my 1040 STF apart and combined all the bits to make an STE (also upgraded to 4MB and TOS 2.06) in a good condition case (also replaced the disk drive with the funkier looking one from the STF - the one with the really chunky eject button underneath the slot) with a working keyboard, and an STF in a beat-up case with less-cool looking disk drive and knackered keyboard. I also enlarged the holes in the casing around the enhanced joystick ports (Did it really carefully, though, not leaving any scratches or rough edges), so regular D plugs would fit and not just the impossible-to-get-hold-of moulded D plugs. Unfortunately, I did bodge up the floppy drive transplant, and had to re drill the mounting holes in the floppy drive (being extra careful not to get swarf into the drive mechanism) and mount it with aluminium brackets, but it all fits nicely now. Finally, I replaced the factory-soldered ROM chip size selector jumpers with actual pin jumpers and shunts, to make swapping OSs easier. Because it was all with authentic Atari components (aside from raw materials for the floppy re-mount and nuts and bolts), I made an exception to the "original case" rule.

BTW, has anyone else noticed a design weakness in the earlier Atari mice(the ones with the smaller diameter rollers)? My first one had to be repaired because when dropped on the floor once (something most other mice survive perfectly well) the little plastic lugs holding the spindles in place sheared right off and had to be glued back. Or perhaps the design was OK, but the plastic has failed over time...

It's really not a big deal. It's nice to see this kind of enthusiasm :)
But for archival purposes it makes things easier if all of the case
questions and answers are under one "falcon case" thread.

No, you are correct. I suppose in my rush to gather info and get answes, I got carried away, and because of that I apologize.

A part of me is frustrated and saddened by the current state of the Atari computer market. I suppose I should just be happy with the fact that there is still some support for our favorite computer.

Let me end by saying this, I need all the guidance any persons are willing to give. being rather tight financially (to young adults going to college) combined with no Atari computer owners/users near me makes for a difficult time.

OK, I announce that I plan now to produce 42 or more new CT60.

Please check www.czuba-tech.com for NEW price, NEW features, NEW fitting
with solders page and new benchs pages !
No more EC support, no more CT60 without 060 !
Only the CT60 with full 060 at 66 MHz.

I need to know very quickly how many people want to buy !!
So, I accept from NOW your promise to buy and in few days I will give infos
to pay me (I need this money to pay the factory that will launch the
production !).

Shipping will be from beginning of April 2004 to end of April 2004 for the
lastest orderers !
No more delay ! CT60 is ok and don't need debugging ! Production is ok and
factory is ready (they are checking since this morning the market to find
the chips to assemble 42 or more boards !).

From: Paul O'Neill <me@mrpon.com>
Message-ID: <jscZb.12$P11.9@newsfe1-win>
Source record: 20367

Hi there,

If you're reading this then I hope you have a Condor Supercharger PC emulator for the Atari ST. My question is, am I missing anything, as I don't have my ST I cannot test it, my contents are:

1 x Supercharger
1 x male - male lead (goes into the DMA bus port)
1 x power supply, with two pin connector (ie: needs a shaver plug to work)

When I plug the power into the back of the Supercharger the led lights up, however I'm sure I'm missing another lead. Isn't there a pass-thru joystick lead or something?

Any help would be appreciated, thanks.

Paul

I had one years ago...
The joystick lead came with the SC stock, and provides the 5v power supply (plugs into the D/C PS jack), that's it. To free up the joystick port, most folks got an external power supply (I did anyway). So...If you have a proper power supply, then no, you don't need any joystick lead.

It's been years and years since I had an SC...it was pretty good tho'...the thing actually ran Windows 3.1, albeit in monochrome. I have to admit I prefered DOS apps due to memory/speed constraints. It did a really good job of running Xerox's Ventura Publisher!

I do not understand your complaint. The second run was planned and
talked about months ago. In fact many of us are on a waiting list.
There was definetly enough time for throwing 299 EUR together.

That's why I hedged and said "in case" ;-)

Always worth a try though!

Put simply, it's just a chip that was left off the early STEs.
Nothing to do with serial transfers.

1594. Belgium ftp-server is back online

Hello/Bonjour,

As today the Belgian Atari ftp-server is again reachable through
anonymous ftp.

Aujourd'hui le serveur ftp belge consacrï¿½ ï¿½ Atari est ï¿½ nouveau
utilisable avec une connection anonyme.

CU

Things are very difficult these days. Seems you and I are perhaps in the
same boat. Unfortunately there's no easy or cheap way to make a really
nice Falcon like others have, same with TT's. My TT030 has over $1000 of
modifications now, the falcon has at least $500 and I paid $400 for it.
That's a lot of money for many years old technology, but I consider it
worth it. And I think in the end, I will have some of the rarest upgrades
and accelerators worth hopefully much more than I paid for them even after
I enjoyed them for years.

The best thing to do is google around and check out
http://www.ataritoday.com, read through news archives on atari-users.net,
and atari-source.com (linked from there). Also check out dhs, watch some
demos, etc. Check out what is available and read through archives here.
You will find deep long drawn out discussions on why using mint or magic
on what configurations, etc.

Part of your decisions completely depend on what you intend to do with
your Falcon. For me, a CT60 overclocked at 92.5MHz with a 25MHz bus is
all too important :)

That said, the more users we have to use the software we're writing and
porting, the better :)

Bonsoir Martin,
```

D sol, en ce qui me concerne, rien faire, ni de mon FalCT60, ni de mon PC
:-(
Pourtant, j'ai bien acc s d'autres sites FTP.
Sur Chapelie, j'ai droit un TimeOut :-(

I have a similar setup and it doesn't matter where you plug the cable as
long as it is terminated on the other end. Which controller are you using?
